Casanova, 2024-12-01 This book covers whole Europe within its geographical limits providing not only an overview about biogeography and recent taxonomic status of Charophyte species but also in depth information about recent knowledge about ecology ontogenesis morphology palaeontology and systematics of this group of algae This is the first comprehensive treatment of European Charophytes In addition the reader for the first time is provided by definitions of terms applied to Charophytes sorting out several previous confusions about terminology Special attention was paid on oospores in order to exploit their potential for supporting species delineation as well as analysis of sediment records A red list dealing also with threats and habitat conditions completes the book Altogether more than 70 taxon are described in detail each of the descriptions giving full information about morphology habitat conditions distribution as well as variability important characters for determination are illustrated by photographs and drawings Hints for correct determination are given in a separate para allowing correct species delineation even for critical species This together with a set of determination keys will allow beginners and practitioners to get familiar with the determination of Charophytes being often regarded notoriously difficult in the past Authored by a large group of 70 specialists from all over Europe and Overseas a commonly agreed taxonomy is provided and all debates about taxonomic status and nomenclatural problems have been discussed beforehand extensively By this a sound reference for applied aspects is given allowing for reliable cross country comparisons especially with respect to bioindication purposes but also serving ground for biogeographical research biodiversity issues and the emerging field of elucidating the process of territorialisation of land plants The authors hope that this book will become the reference work for the coming decades it was designed for

Thomaz, ZhongQiang Li, Te CAO, Katya E. Kovalenko, 2020-06-16 Aquatic plants refer to a diverse group of aquatic photosynthetic organisms large enough to be seen with the naked eye and the vegetative parts of which actively grow either permanently or periodically for at least several weeks each year submerged below floating on or growing up through the water surface These include aquatic vascular plants aquatic mosses and some larger algae Aquatic plants are grouped into life forms each of which relates differently to limiting factors and has distinct ecological functions in aquatic ecosystems Life form groups include emergent macrophytes plants that are rooted in sediment or soils that are periodically inundated with all other structures extending into the air floating leaved macrophytes rooted plants with leaves that float on the water surface submersed macrophytes rooted plants growing completely submerged free submerged macrophytes which are not rooted but attached to other macrophytes or submerged structures and free floating macrophytes plants that float on the water surface Aquatic plants play an important role in the structure and function of aquatic ecosystems by altering water movement regimes providing shelter and refuge and serving as a food source In addition aquatic plants produce large standing crops which can also stabilize sediments accumulate large amounts of nutrients thus improving water healthy Thus because of their ecological role aquatic plants are an important component of aquatic ecosystems Aquatic plants are very vulnerable to human activities and global changes and many species of the plants had become endangered in the past several decades due to habitat loss flooding damming over foraging biological invasion and eutrophication which might not be halted but enforced in the future when more extreme weathers coincide with enhanced human activities **Archiv Für Hydrobiologie** ,1995
