Boundary Value Problems and Elasticity and Their Connection with Failure Initiation Zohar Yosibash, 2011-12-02

This introductory and self contained book gathers as much explicit mathematical results on the linear elastic and heat conduction solutions in the neighborhood of singular points in two dimensional domains and singular edges and vertices in three dimensional domains These are presented in an engineering terminology for practical usage The author treats the mathematical formulations from an engineering viewpoint and presents high order finite element methods for the computation of singular solutions in isotropic and anisotropic materials and multi material interfaces The proper interpretation of the results in engineering practice is advocated so that the computed data can be correlated to experimental observations The book is divided into fourteen chapters each containing several sections Most of it the first nine Chapters addresses two dimensional domains where only singular points exist The solution in a vicinity of these points admits an asymptotic expansion composed of eigenpairs and associated generalized flux stress intensity factors GFIFs GSIFs which are being computed analytically when possible or by finite element methods otherwise Singular points associated with

weakly coupled thermoelasticity in the vicinity of singularities are also addressed and thermal GSIFs are computed The computed data is important in engineering practice for predicting failure initiation in brittle material on a daily basis Several failure laws for two dimensional domains with V notches are presented and their validity is examined by comparison to experimental observations A sufficient simple and reliable condition for predicting failure initiation crack formation in micron level electronic devices involving singular points is still a topic of active research and interest and is addressed herein Explicit singular solutions in the vicinity of vertices and edges in three dimensional domains are provided in the remaining five chapters New methods for the computation of generalized edge flux stress intensity functions along singular edges are presented and demonstrated by several example problems from the field of fracture mechanics including anisotropic domains and bimaterial interfaces Circular edges are also presented and the author concludes with some remarks on open questions This well illustrated book will appeal to both applied mathematicians and engineers working in the field of fracture mechanics and singularities

Groups and Topological Dynamics Volodymyr Nekrashevych, 2022-10-07 This book is devoted to group theoretic aspects of topological dynamics such as studying groups using their actions on topological spaces using group theory to study symbolic dynamics and other connections between group theory and dynamical systems One of the main applications of this approach to group theory is the study of asymptotic properties of groups such as growth and amenability The book presents recently developed techniques of studying groups of dynamical origin using the structure of their orbits and associated groupoids of germs applications of the iterated monodromy groups to hyperbolic dynamical systems topological full groups and their properties amenable groups groups of intermediate growth and other topics The book is suitable for graduate students and researchers interested in group theory transformations defined by automata topological and holomorphic dynamics and theory of topological groupoids Each chapter is supplemented by exercises of various levels of complexity

Direct Connection Project ,2008 **Electron-Microscopy-Based Tools for Imaging Cellular Circuits and Organisms** Yoshiyuki Kubota,2019-12-30 *Advanced Connection Systems for Architectural Glazing* Roham Afghani Khoraskani,2015-03-02 This book presents the findings of a detailed study to explore the behavior of architectural glazing systems during and after an earthquake and to develop design proposals that will mitigate or even eliminate the damage inflicted on these systems The seismic behavior of common types of architectural glazing systems are investigated and causes of damage to each system identified Furthermore depending on the geometrical and structural characteristics the ultimate horizontal load capacity of glass curtain wall systems is defined based on the stability of the glass components Detailed attention is devoted to the incorporation of advanced connection devices between the structure of the building and the building envelope system in order to minimize the damage to glazed components An innovative new connection device is introduced that results in a delicate and functional system easily incorporated into different architectural glazing systems including those demanding maximum transparency Generic Object Recognition Using Form & Function Louise Stark, Kevin Bowyer,1996 This monograph provides a detailed record of the GRUFF research project The goal of the GRUFF project is to develop techniques for robotic vision systems to recognize objects by reasoning about their intended function

rather than matching to a pre defined database of 2 D object appearances or 3 D object shapes The contributions of this work are a demonstration of the feasibility of the form and function approach to reasoning about 3 D shapes a demonstration of the concept of using a small number of knowledge primitives as component building blocks in creating a function based definition of an object category and an indexing mechanism to make processing for recognition more efficient without any substantial decrease in correctness of classification Results are given for the analysis of over 500 3 D shape descriptions created with a solid modeling tool and over 200 shape descriptions extracted from real laser range finder images
