### *Message from our chair*

Dear colleagues and friends of the HRWM family!

It is almost exactly 100 years ago that a virus caused one of the most severe pandemics in human history. The so-called Spanish flu (1918-1919), caused by the H1N1 influenza A virus, infected 500 million people and has cost several million people their lives. Now, in the last few months, we are facing the COVID-19 pandemic and the virus SARS-CoV-2 has changed our lives dramatically, both personally and professionally, and will continue to affect them. Our sympathy goes out to all those who have lost family members or friends or who have had worries about them.

In contrast to 1918, all scientific forces have now been activated and bundled on a global scale and interdisciplinary knowledge about this infectious disease was developed almost online. Methods, analyses, models, statistics and prognoses were developed by virologists, epidemiologists, infectiologists and statisticians, measures with different approaches were implemented by the governments and complied with by the population.

## **Health Related Water Microbiology 199:**

Health-Related Water Microbiology 2000 R. Morris, J. Jofre, 2001 The quality and quantity of papers given at successive Health related Water Microbiology Symposia continues to increase and the millennium meeting in Paris saw the highest ever number of delegates and presentations Of necessity these selected proceedings can only give a taste of the overall content of the Symposium but nevertheless reflect on the growing interest and awareness of the importance of the microbial contamination of our environment and the implications for human health Numerous contributions address different aspects of one of the waterborne diseases of most concern cryptosporidiosis However this did not preclude reports on outbreaks of other diseases Several contributions raised important questions how should epidemiological data be interpreted and what methods are valid for regulatory monitoring were of particular interest Newly developed analytical methods have allowed a greater range of pathogens to be detected However such techniques have little significance if they cannot be used for the practical evaluation of water quality and part of this is the acquiring of monitoring data upon which future treatment and policy decisions can be made The 43 papers selected here cover standards and quality assurance risk assessment epidemiology and disease outbreaks monitoring microbial survival disinfection wastewater treatment methodology and microbial toxins

**Health-related Water Microbiology 1986** W. O. K. Grabow, 1987 The papers from the seminar cover pertinent health related issues of viruses bacteria and protozoa in water

**Oceans and Health:** Shimshon Belkin, Rita R. Colwell, 2006-10-12 The importance of combating infectious diseases has received international attention providing the opportunity for a multidisciplinary approach that combines medicine with other scientific and technological capabilities notably information technology nanotechnology and biotechnology In fact it has been predicted that the future will bring a merging of these technologies with the cognitive and behavioral sciences major forces that have the potential to balance the world's inequities The scientific community and world leaders must work together to use knowledge and its applications to improve the condition of the planet The connection between infectious diseases and the oceans provides a paradigm for this perspective A stark global context indisputably frames all human health issues in the twenty first century the world wide movement of people and goods Throughout the past half century international travel has skyrocketed there are more than 500 million international arrivals per year The greatest increase has taken place since the mid 1990s The world has become integrated and global consequently the notion that it is possible to successfully eradicate a disease from the face of the planet has become simplistic Infectious disease is a moving target and climate shifts will affect any disease that has an environmentally sensitive stage or vector

Recognizing signals from climate models and incorporating them into health measures can provide new opportunities for proactive rather than reactive approaches to public health Thus careful attention to the role of the oceans in human health can offer new avenues of research that will provide new means of predicting and preventing those diseases that are rooted in the

environment In this volume pathogens in the sea are reviewed by Colin Munn who provides a broader perspective for the topic of pathogenic microorganisms associated with the world oceans      **Microbiology of Waterborne Diseases**

,2013-11-08 The second edition of Microbiology of Waterborne Diseases describes the diseases associated with water their causative agents and the ways in which they gain access to water systems The book is divided into sections covering bacteria protozoa and viruses Other sections detail methods for detecting and identifying waterborne microorganisms and the ways in which they are removed from water including chlorine ozone and ultraviolet disinfection The second edition of this handbook has been updated with information on biofilms and antimicrobial resistance The impact of global warming and climate change phenomena on waterborne illnesses are also discussed This book serves as an indispensable reference for public health microbiologists water utility scientists research water pollution microbiologists environmental health officers consultants in communicable disease control and microbial water pollution students Focuses on the microorganisms of most significance to public health including E coli cryptosporidium and enterovirus Highlights the basic microbiology clinical features survival in the environment and gives a risk assessment for each pathogen Contains new material on antimicrobial resistance and biofilms Covers drinking water and both marine and freshwater recreational bathing waters      **WATER**

**Animal Waste, Water Quality and Human Health** A. Dufour, Jamie Bartram, 2012-10-14 Domestic animals contaminate recreational waters and drinking water sources with excreta and pathogens but this threat to public health is inadequately understood and is insufficiently addressed in regulations More than 85% of the world's faecal wastes is from domestic animals such as poultry cattle sheep and pigs These animals harbor zoonotic pathogens that are transported in the environment by water especially runoff However little information exists on health effects associated with exposure to this potential hazard to human health and water standards focused on control of human fecal contamination do reflect the contribution of non human fecal contamination to risk Does compliance with current monitoring practices using microbial indicators provide protection against animal and bird sources of fecal contamination Prepared with contributions from a group of international experts Animal Waste Water Quality and Human Health considers microbial contamination from domestic animal and bird sources and explores the health hazards associated with this microbial contamination and approaches to protecting public health Animal Waste Water Quality and Human Health will be of interest to regulators with responsibility for recreational waters drinking water quality and water reuse policymakers working in water quality public health and agriculture decision makers responsible for livestock management and scientists and practitioners concerned with many affected subjects Topics covered include Credible waterborne zoonotic pathogens are discussed and ranked according to their potential hazard level Each pathogen is described with regard to their sources reservoirs and infectivity Faecal production rates of various domestic animals are discussed alongside pathogen transmission in animal populations pathogen prevalence in animals and supershedders Transport of fecal indicator organisms and their episodic occurrence in catchments Interventions for improving food safety and reducing production losses The impact of interventions e.g enhanced attenuation and storage to prevent spills benchmarking against best management practices to reduce diffuse source contamination Models to inform design of farm scale best management practices and the effectiveness of best management practices for attenuating pathogen transport within catchments The complex nature of human exposure to zoonotic waterborne pathogens including the relationships among livestock waste contamination water impairment zoonotic pathogens and human infection
