**Heart Cell Coupling and Impulse Propagation in Health and Disease** Walmor C. de Mello, M.J. Janse, 2012-12-06  
Heart Cell Coupling and Impulse Propagation in Health and Disease includes an up to date review on how heart cells communicate and impulse propagation under normal as well as under pathological conditions The complexity of intercellular coupling and impulse propagation is discussed providing the reader with a broad view of the importance of these processes and how they contribute to the generation of cardiac arrhythmias and heart failure The different aspects and intricacies of heart cell communication is discussed by different authors each one an expert in their own field The present publication will be of interest to cardiologists electrophysiologists heart physiologists cardiac pharmacologists biophysicists and cell or molecular biologists

**Renin Angiotensin System and the Heart** Walmor C. De Mello, 2005-10-31 Recent studies have shown that the heart possesses an intrinsic renin angiotensin system that is controlled by tissue specific parameters that are activated by biomechanical stress This book reviews the latest information on the way in which both the plasma and cardiac renin angiotensin systems affect heart function It covers the cell and molecular biology of these systems with contributions on renin synthesis uptake and the intracellular signalling pathways Particular insight comes from transgenic mouse models in which either mouse or human genes for various components of the renin angiotensin system are expressed Other topics covered include wound healing as well as the trophic effects of aldosterone Contains the most recent findings on the renin angiotensin system and the heart Written by an international team of distinguished scientists Covers both the cellular and molecular basis of the renin angiotensin system and the clinical relevance of this research

*The Local Cardiac Renin-Angiotensin Aldosterone System* Edward D. Frohlich, Richard N. Re, 2006-01-26 How exciting it is to see a field so well established as the renin angiotensin system continue to grow and mature Originally following the original identification of renin by Tigerstedt and Bergman over 100 years ago workers in this area spent years attempting to establish its role in experimental and renal hypertension The early work by Goldblatt in 1934 demonstrated that the placement of a clip around a renal artery was clearly related to the subsequent development of hypertension However it wasn't until the simultaneous finding by two different geographically separated teams Page et al in the United States and Braun Menendez et al in Argentina that the peptide angiotensin was identified Thus the rate limiting enzyme renin was released from the kidney and catalyzed a biochemical cascade which was eventually shown to produce the elevated arterial pressure Subsequently many workers contributed to the elucidation of the concept and sequence of angiotensin I1 generation Thus the enzyme renin acted upon its protein substrate produced in the liver to liberate the decapeptide angiotensin I which upon circulating through the pulmonary circulation finally produced the potent octapeptide angiotensin Several important subsequent findings demonstrated that angiotensin I1 promoted the release of the adrenal corticosteroid from that gland thereby resulting in a larger system the renin angiotensin aldosterone system Further this system demonstrated a classical

biofeedback and the circulating octapeptide was shown to have additional biological activities in organs other than heart vessels kidney adrenals and even brain

*Remodeling of cardiac passive electrical properties and susceptibility to ventricular and atrial arrhythmias* George E. Billman, 2015-09-25 The effective management of cardiac arrhythmias either of atrial or of ventricular origin remains a major challenge Sudden cardiac death due to ventricular tachyarrhythmias remains the leading cause of death in industrialized countries while atrial fibrillation is the most common rhythm disorder an arrhythmia that s prevalence is increasing and accounts for nearly one quarter of ischemic strokes the elderly population Yet despite the enormity of the problem effective therapeutic interventions remain elusive In fact several initially promising antiarrhythmic agents were found to increase rather than decrease mortality in patients recovering from myocardial infarction The question then is what went wrong why have these interventions proven to be so ineffective An obvious answer is the drugs were designed to attack the wrong therapeutic target Clearly targeting single ion channels using either isolated ion channels or single myocytes preparations has proven to be less than effective What then is the appropriate target It is well established that cardiac electrical properties can vary substantially between single cells and intact preparations One obvious example is the observation that action potential duration is much longer in isolated cells as compared to multi cellular preparations or intact hearts Due to the low electrical resistance between adjacent myocytes the cells act in coordinated fashion producing electrotonic interdependence between neighboring cells Myocardial infarction and or acute ischemia provoke profound changes in the passive electrical properties of cardiac muscle In particular electrotonic uncoupling of the myocytes disrupts the coordinated activation and repolarization of cardiac tissue The resulting compensatory changes in ionic currents decrease cardiac electrical stability increasing the risk for life threatening changes in the cardiac rhythm Thus the electrical properties of myocardial cells must be considered as a unit rather than in isolation It is the purpose of this Research Topic to evaluate the largely neglected relationship between changes in passive electrical properties of cardiac muscle and arrhythmia formation

Gap Junctions: Molecular Basis of Cell Communication in Health and Disease, 1999-12-22 Since the first gap junction protein connexin was cloned over a decade ago more than a dozen connexin genes have been cloned Consequently a wealth of information on the molecular basis of gap junctional communication has been accumulated This book pays tribute to this exciting era in the history of cell communication research by documenting the great strides made in this field as a result of the merging of biophysics and molecular biology two of the most powerful approaches to studying the molecular basis of membrane channel behavior Twenty eight comprehensive chapters authored by internationally recognized leaders in the field discuss the biophysical physiological and molecular characteristics of cell to cell communication via gap junctions Key aspects of molecular structure formation gating conductance and permeability of vertebrate and invertebrate gap junction channels are highlighted In addition a number of chapters focus on recent discoveries that implicate connexin mutations and alterations of gap junctional communication in

the pathogenesis of several diseases including the X linked Charcot Marie Tooth demyelinating disease some forms of inherited sensorineural deafness malignant transformation cardiac malformations and arrhythmia eye lens cataract and Chagas disease      **Renin Angiotensin System and Cardiovascular Disease** Walmor C. DeMello,Edward D.
