

Heat Transfer in the Biosphere

- The earth's surface is constantly unevenly heated.
- Denser, cooler air is constantly displacing warmer, less dense air. This is the main force that drives the movement of the atmosphere (aka wind).
- The trend is for the sinking air in the poles to move toward the equator and force the lighter, warmer air at the equator upwards.
- Similar patterns of heating and cooling occur in the earth's oceans.
- Land masses interfere with this. This effects climate.
