

Magnificent movers

All cats are extremely agile and can leap with great power, although, apart from the cheetah, they can run fast over only short distances (pp. 42-43). Unlike many other carnivores, the cat has collar bones, which prevent it from jarring its shoulders when it leaps from a height. The shoulder blades are placed well at the sides of the cat's chest, which helps it to climb. Cats that spend a lot of time in trees, such as the leopard (pp. 32-33), have long tails for balance. All cats walk on their toes and their feet have thick, soft pads so they can move quietly.

Wild cat strikes
A big cat is so powerful that it can kill with one lunge of a paw. This cat shows the strength and speed that hunt another member of its pride.

Cat pads are the same shape as human pads at the end of toes.

Cat skeletons are built just as it helps leap.

Nine lives

Cats can fall from great heights with almost no harm to their feet. Many of the small cats, as well as the leopard, spread much of their body in flares. Their highly developed sense of balance helps them feel how moving outside the square, while clinging along a thin branch. The various species has evolved so that the cat can right itself and right to avoid damaging its body on landing.

When running, cats spread their paws together in a tight group and will stick big claws at almost

One giant leap...

Cats jump by flexing and releasing the muscles of the torso and legs, while balancing with the tail. Unlike many other jumping animals, a cat can judge its landing position with great accuracy. This is essential for a hunter of fast-moving, small prey.

Cat is at full stretch in mid-leap.

Cool cat

Most cats seem to enjoy swimming, apart from tigers, who spread a fan amount of water over their water. Tigers living in the tropical rain forests of Asia use the water to keep cool.

Front paws grab and cat begins to bring back paws forward.

All four paws touch ground.

Tail is extended for balance like the wire carrier by a tightrope walker.

Running wild

When a cat runs it pushes off with both back legs at the same time, but places the front paws down separately. Examine the drawings to see the sequence of 100% to show how a cat moves when running.

Forward

Practice

All cats and kittens have to exercise their bodies and muscles before they can be as flexible as their parents. This young cat is practising how to jump to its body, but with practice it will soon be as agile as its mother.

Lower legs and feet are not yet developed.

Up a gum tree

All felines have to learn to climb. At first, they often venture too far up a tree and are then terrified of going up or down. After a few false starts, however, all but the most timid jump to earth and land on their feet.

Balancing act

This cat shows how it can walk along the top of a very high, very narrow fence. It places its paws exactly one in front of the other and is never in danger of falling.
