**Module 3. National tuberculosis prevalence surveys** World Health Organization, 2025-07-10 National TB prevalence surveys are a key tool used by WHO to estimate the burden of TB disease in a country Repeat surveys allow for the assessment of trends and of the impact of interventions to reduce the burden of disease thus helping to track progress towards the milestones and targets for reductions in TB incidence set in the WHO End TB Strategy Between 2007 and 2024 a total of 36 surveys in 32 countries were implemented using the screening and diagnostic methods recommended by WHO These surveys were guided by two WHO publications first in 2007 and then in 2011 Since then major technological developments have occurred and important lessons have been learned from surveys implemented This new edition is

intended to support the design implementation analysis and reporting of national TB prevalence surveys in the period up to about 2030 It includes major revisions to the diagnostic algorithms that are recommended for use in national TB prevalence surveys and in turn the case definitions used to count the number of survey participants who have TB disease updated guidance on sampling design and the analysis and reporting of data based on the new diagnostic algorithms and case definitions updated and considerably expanded guidance on data management updated guidance on chest radiography clinical management survey management and field operations and new chapters on testing for HIV and comorbidities survey monitoring comparisons with previous surveys reporting and dissemination of survey results and use of survey data

The handbook also targets paediatricians and other health care workers, HCWs in the public and private sectors, school health services, civil society and community based organizations and health care educators.

*Semiclassical Approach to Mesoscopic Systems* Daniel Waltner, 2012-01-05. This volume describes mesoscopic systems with classically chaotic dynamics using semiclassical methods which combine elements of classical dynamics and quantum interference effects. Experiments and numerical studies show that Random Matrix Theory (RMT) explains physical properties of these systems well. This was conjectured more than 25 years ago by Bohigas, Giannoni and Schmit for the spectral properties. Since then it has been a challenge to understand this connection analytically. The author offers his readers a clearly written and up to date treatment of the topics covered. He extends previous semiclassical approaches that treated spectral and conductance properties. He shows that RMT results can in general only be obtained semiclassically when taking into account classical configurations not considered previously, for example those containing multiply traversed periodic orbits. Furthermore, semiclassics is capable of describing effects beyond RMT. In this context, he studies the effect of a non zero Ehrenfest time which is the minimal time needed for an initially spatially localized wave packet to show interference. He derives its signature on several quantities characterizing mesoscopic systems, e.g. dc and ac conductance, dc conductance variance, n pair correlation functions of scattering matrices and the gap in the density of states of Andreev billiards.

*Intensity Modulated Radiation Therapy* Arno J. Mundt, John C. Roeske, 2005. Presents the technical aspects of IMRT and the clinical aspects of planning and delivery. The volume explores a practical approach for radiation oncologists and medical physicists initiating or expanding an IMRT program, the fundamental biology and physics of IMRT, a site by site review of IMRT techniques with clinical examples and reviews of published outcome studies.
