

Quantifying earthquakes: Intensity

1783: First intensity scale devised by D. Pignataro with 5 levels (slight, moderate, strong, v. strong, violent)

1823: Expanded to 6 levels with more detail by P. Egen

1846: First use of "isoseismals" to define areas of equal intensity and effectively to "locate" an earthquake

1883: Rossi-Forel scale with 10 divisions. Widely used, although much was "lumped" at level X.

1902: Initial Mercalli Scale. 10 grades

1931: Modified Mercalli Scale with 12 grades. Still in use today

1999: Community Internet Intensity Maps

Rainfall Thresholds and Other Approaches for Landslide Prediction and Early Warning Samuele Segoni, Stefano Luigi Gariano, Ascanio Rosi, 2021-06-22 Landslides are destructive processes causing casualties and damage worldwide The majority of the landslides are triggered by intense and or prolonged rainfall Therefore the prediction of the occurrence of rainfall induced landslides is an important scientific and social issue To mitigate the risk posed by rainfall induced landslides landslide early warning systems LEWS can be built and applied at different scales as effective non structural mitigation measures Usually the core of a LEWS is constituted of a mathematical model that predicts landslide occurrence in the monitored areas In recent decades rainfall thresholds have become a widespread and well established technique for the prediction of rainfall induced landslides and for the setting up of prototype or operational LEWS A rainfall threshold expresses with a mathematic law the rainfall amount that when reached or exceeded is likely to trigger one or more landslides Rainfall thresholds can be defined with relatively few parameters and are very straightforward to operate because their application within LEWS is usually based only on the comparison of monitored and or forecasted rainfall This Special Issue collects contributions on the recent research advances or well documented applications of rainfall thresholds as well as other innovative methods for landslide prediction and early warning Contributions regarding the description of a LEWS or single components of LEWS e g monitoring approaches forecasting models communication strategies and emergency management are also welcome We encourage in particular the submission of contributions concerning the definition and validation of rainfall thresholds and their operative implementation in LEWS Other approaches for the forecasting of landslides are also of interest such as physically based modelling hazard mapping and the monitoring of hydrologic and geotechnical indicators especially when described in the framework of an operational or prototype early warning system
