Extinctions In The History Of Life:

Extinctions in the History of Life Paul D. Taylor, 2004-11-11 Extinction is the ultimate fate of all biological species over 99 percent of the species that have ever inhabited the Earth are now extinct The long fossil record of life provides scientists with crucial information about when species became extinct which species were most vulnerable to extinction and what processes may have brought about extinctions in the geological past Key aspects of extinctions in the history of life are here reviewed by six leading palaeontologists providing a source text for geology and biology undergraduates as well as more advanced scholars Topical issues such as the causes of mass extinctions and how animal and plant life has recovered from these cataclysmic events that have shaped biological evolution are dealt with This helps us to view the biodiversity crisis in a broader context and shows how large scale extinctions have had profound and long lasting effects on the Earth's biosphere

Lost Creatures of the Earth Jon Erickson, 2014-05-14 Presents an examination of possible phenomena that caused dramatic changes in the earth's surface that could explain periodic mass extinctions and the evolution of new species

Patterns and Processes in the History of Life D.

Jablonski,D.M. Raup,2012-12-06 Hypothesis testing is not a straightforward matter in the fossil record and here too interactions with biology can be extremely profitable Quite simply predictions regarding long term consequences of processes observed in living organisms can be tested directly using paleontological data if those living organisms have an adequate fossil record thus avoiding the pitfalls of extrapolative approaches We hope to see a burgeoning of this interactive effort in the coming years Framing and testing of hypotheses in paleontological subjects inevitably raises the problem of inferring process from pattern and the consideration and elimination of a broad range of rival hypotheses is an essential procedure here In a historical science such as paleontology the problem often arises that the events that are of most interest are unique in the history of life For example replication of the metazoan radiation at the beginning of the Cambrian is not feasible However decomposition of such problems into component hypotheses may at least in part alleviate this difficulty For example hypotheses built upon the role of species packing might be tested by comparing evolutionary dynamics both morphological and taxonomic during another global diversification such as the biotic rebound from the end Permian extinction which removed perhaps 95% of the marine species see Valentine this volume The subject of extinction and mass extinction in particular has become important in both paleobiology and biology

A New History of Life

Peter Ward,Joe Kirschvink,2015-04-07 The history of life on Earth is in some form or another known to us all or so we think A New History of Life offers a provocative new account based on the latest scientific research of how life on our planet evolved the first major new synthesis for general readers in two decades Charles Darwin s theories first published more than 150 years ago form the backbone of how we understand the history of the Earth In reality the currently accepted history of life on Earth is so flawed so out of date that it s past time we need a New History of Life In their latest book Joe Kirschvink and Peter Ward will show that many of our most cherished beliefs about the evolution of life are wrong Gathering and analyzing years of discoveries and research not yet widely known to the public A New History of Life proposes a different origin of species than the one Darwin proposed one which includes eight foot long centipedes a frozen snowball Earth and the seeds for life originating on Mars Drawing on their years of experience in paleontology biology chemistry and astrobiology experts Ward and Kirschvink paint a picture of the origins life on Earth that are at once too fabulous to imagine and too familiar to dismiss and looking

forward A New History of Life brilliantly assembles insights from some of the latest scientific research to understand how life on Earth can and might evolve far into the future

The Processes of Life Lawrence E. Hunter, 2012-01-13 A brief and accessible introduction to molecular biology for students and professionals who want to understand this rapidly expanding field Recent research in molecular biology has produced a remarkably detailed understanding of how living things operate Becoming conversant with the intricacies of molecular biology and its extensive technical vocabulary can be a challenge though as introductory materials often seem more like a barrier than an invitation to the study of life This text offers a concise and accessible introduction to molecular biology requiring no previous background in science aimed at students and professionals in fields ranging from engineering to journalism anyone who wants to get a foothold in this rapidly expanding field It will be particularly useful for computer scientists exploring computational biology A reader who has mastered the information in The Processes of Life is ready to move on to more complex material in almost any area of contemporary biology

Extinction Douglas H. Erwin, 2015-03-22 Some 250 million years ago the earth suffered the greatest biological crisis in its history Around 95 percent of all living species died out a global catastrophe far greater than the dinosaurs' demise 185 million years later How this happened remains a mystery But there are many competing theories Some blame huge volcanic eruptions that covered an area as large as the continental United States others argue for sudden changes in ocean levels and chemistry including burps of methane gas and still others cite the impact of an extraterrestrial object similar to what caused the dinosaurs' extinction Extinction is a paleontological mystery story Here the world's foremost authority on the subject provides a fascinating overview of the evidence for and against a whole host of hypotheses concerning this cataclysmic event that unfolded at the end of the Permian After setting the scene Erwin introduces the suite of possible perpetrators and the types of evidence paleontologists seek He then unveils the actual evidence moving from China where much of the best evidence is found to a look at extinction in the oceans to the extraordinary fossil animals of the Karoo Desert of South Africa Erwin reviews the evidence for each of the hypotheses before presenting his own view of what happened Although full recovery took tens of millions of years this most massive of mass extinctions was a powerful creative force setting the stage for the development of the world as we know it today In a new preface Douglas Erwin assesses developments in the field since the book's initial publication
