Face Recognition A Special Issue Of The European Journal Of Cognitive Psychology:

Cognitive and Computational Aspects of Face Recognition Tim Valentine,2017-04-07 How can computers recognize faces Why are caricatures of famous faces so easily recognized Originally published in 1995 much of the previous research on face recognition had been phenomena driven Recent empirical work together with the application of computational mathematical and statistical techniques have provided new ways of conceptualizing the information available in faces These advances have led researchers to suggest that many phenomena can be explained by the structure of the information available in the population s of faces This broad approach has drawn together a number of apparently disparate phenomena with a common theoretical basis including cross race recognition the distinctiveness of faces the production and recognition of caricatures and the determinants of facial attractiveness This title provides a state of the art review of the field at the time in which the authors use a wide variety of approaches What is common to all is that the authors base the accounts of the phenomena they study or their model of face recognition on the statistics of the information available in the population of faces On publication this title was a comprehensive up to date review of an important area of research in face recognition written by active researchers It includes contributions from mathematics computer science and neural network theory as well as psychology It is aimed at research workers and postgraduate students and will be of interest to cognitive psychologists and computer scientists interested in face recognition It will also be of interest to those working on neural network models of visual recognition perceptual development expertise in visual cognition as well as facial attractiveness and caricature **Dynamic Vision: From Images To Face Recognition** Shaogang Gong,Stephen J Mckenna,Alexandra Psarrou,2000-05-11 Face recognition is a task that the human vision system seems to perform almost effortlessly yet the goal of building computer based systems with comparable capabilities has proven to be difficult The task implicitly requires the ability to locate and track faces through often complex and dynamic scenes Recognition is difficult because of variations in factors such as lighting conditions viewpoint body movement and facial expression Although evidence from psychophysical and neurobiological experiments provides intriguing insights into how we might code and recognise faces its bearings on computational and engineering solutions are far from clear The study of face recognition has had an almost unique impact on computer vision and machine learning research at large It raises many challenging issues and provides a good vehicle for examining some difficult problems in vision and learning Many of the issues raised are relevant to object recognition in general This book describes the latest models and algorithms that are capable of performing face recognition in a dynamic setting The key question is how to design computer vision and machine learning algorithms that can operate robustly and quickly under poorly controlled and changing conditions Consideration of face recognition as a problem in dynamic vision is perhaps both novel and important The algorithms described have numerous potential applications in areas such as visual surveillance verification access control video conferencing multimedia and visually mediated interaction The book will be of

special interest to researchers and academics involved in machine vision visual recognition and machine learning It should also be of interest to industrial research scientists and managers keen to exploit this emerging technology and develop automated face and human recognition systems It is also useful to postgraduate students studying computer science electronic engineering information or systems engineering and cognitive psychology *Face Recognition* Harry Wechsler,Jonathon P. Phillips,Vicki Bruce,Francoise Fogelman Soulie,Thomas S. Huang,2012-12-06 The NATO Advanced Study Institute ASI on Face Recognition From Theory to Applications took place in Stirling Scotland UK from June 23 through July 4 1997 The meeting brought together 95 participants including 18 invited lecturers from 22 countries The lecturers are leading researchers from academia govemment and industry from allover the world The lecturers presented an encompassing view of face recognition and identified trends for future developments and the means for implementing robust face recognition systems The scientific programme consisted of invited lectures three panels and oral and poster presentations from students attending the AS As a result of lively interactions between the participants the following topics emerged as major themes of the meeting i human processing of face recognition and its relevance to forensic systems ii face coding iii connectionist methods and support vector machines SVM iv hybrid methods for face recognition and v predictive learning and performance evaluation The goals of the panels were to provide links among the lectures and to emphasis the themes of the meeting The topics of the panels were i How the human visual system processes faces ii Issues in applying face recognition data bases evaluation and systems and iii Classification issues involved in face recognition The presentations made by students gave them an opportunity to receive feedback from the invited lecturers and suggestions for future work
