## From Dits To Bits:

**The Computer Contradictionary** Stan Kelly-Bootle, 1995 Ascertain the meaning before consulting this dictionary warns the author of this collection of deliberately satirical misdefinitions New computer cultures and their jargons have burgeoned since this book's progenitor The Devil's DP Dictionary was published in 1981 This updated version of Stan Kelly-Bootle's romp through the data processing lexicon is a response to the Unix pandemic that has swept academia and government to the endlessly hyped panaceas offered to the MIS and to the PC explosion that has brought computer terminology to a hugely bewildered lay audience The original dictionary a pastiche of Ambrose Bierce's famous work parodied chiefly the mainframe and mini folklore of the 1950s 1960s and 1970s This revision adds over 550 new entries and enhances many of the original definitions Key targets are a host of new follies crying out for cynical lexicography including the GUI Phooey iconoclasts object orienteering and the piping of BLObs down the Clinton Gore InfoPike

**Predicting the Winner** Ira Chinoy, 2024-05 Winner of the Ray Hiebert History of Journalism Published Work Award The history of American elections changed profoundly on the night of November 4 1952 An outside the box approach to predicting winners from early returns with new tools computers was launched live and untested on the newest medium for news television Like exhibits in a freak show computers were referred to as electronic brains and mechanical monsters Yet this innovation would help fuel an obsession with numbers as a way of understanding and shaping politics It would engender controversy down to our own time And it would herald a future in which the public square would go digital The gamble was fueled by a crisis of credibility stemming from faulty election night forecasts four years earlier in 1948 combined with a lackluster presentation of returns What transpired in 1952 is a complex tale of responses to innovation which Ira Chinoy makes understandable via a surprising history of election nights as venues for rolling out new technologies refining methods of prediction and providing opportunities for news organizations to shine In Predicting the Winner Chinoy tells in detail for the first time the story of the 1952 election night a night with continuing implications for the way forward from the dramatic events of 2020 21 and for future election nights in the United States

**Information Theory and Evolution** John Avery, 2012 Information Theory and Evolution discusses the phenomenon of life including its origin and evolution and also human cultural evolution against the background of thermodynamics statistical mechanics and information theory Among the central themes is the seeming contradiction between the second law of thermodynamics and the high degree of order and complexity produced by living systems This paradox has its resolution in the information content of the Gibbs free energy that enters the biosphere from outside sources as the author will show The role of information in human cultural evolution is another focus of the book The first edition of Information Theory and Evolution made a strong impact on thought in the field by bringing together results from many disciplines The new second edition offers updated results based on reports of important new research in several areas including exciting new studies of the human mitochondrial and Y chromosomal DNA Another extensive discussion featured in the second edition is contained in a new appendix devoted to the relationship of entropy and Gibbs free energy to economics This appendix includes a review of the ideas of Alfred Lotka Frederick Soddy Nicholas Georgescu Roegen and Herman E Daly and discusses the relevance of these ideas to the current economic crisis The new edition discusses current research on the origin of life the distinction between thermodynamic information and cybernetic information new DNA research and human prehistory developments in current information technology and the relationship between entropy and economics

**A History of Modern Computing, second edition** Paul E. Ceruzzi, 2003-04-08 From the first digital computer to the dot com crash a story of individuals institutions and the forces that led to a series of dramatic transformations This engaging history covers modern computing from the development of the first electronic digital computer through the dot com crash The author concentrates on five key moments of transition the transformation of the computer in the late 1940s from a specialized scientific instrument to a commercial product the emergence of small systems in the late 1960s the beginning of personal computing in the 1970s the spread of networking after 1985 and in a chapter written for this edition the period 1995 2001 The new material focuses on the Microsoft antitrust suit the rise and fall of the dot coms and the advent of open source software particularly Linux Within the chronological narrative the book traces several overlapping threads the evolution of the computer's internal design the effect of economic trends and the Cold War the long term role of IBM as a player and as a target for upstart entrepreneurs the growth of software from a hidden element to a major character in the story of computing and the recurring issue of the place of information and computing in a democratic society The focus is on the United States though Europe and Japan enter the story at crucial points on computing per se rather than on applications such as artificial intelligence and on systems that were sold commercially and installed in quantities      **New Foundations for Information Theory** David Ellerman, 2021-10-30 This monograph offers a new foundation for information theory that is based on the notion of information as distinctions being directly measured by logical entropy and on the re quantification as Shannon entropy which is the fundamental concept for the theory of coding and communications Information is based on distinctions differences distinguishability and diversity Information sets are defined that express the distinctions made by a partition e.g. the inverse image of a random variable so they represent the pre probability notion of information Then logical entropy is a probability measure on the information sets the probability that on two independent trials a distinction or dit of the partition will be obtained The formula for logical entropy is a new derivation of an old formula that goes back to the early twentieth century and has been re derived many times in different contexts As a probability measure all the compound notions of joint conditional and mutual logical entropy are immediate The Shannon entropy which is not defined as a measure in the sense of measure theory and its compound notions are then derived from a non linear dit to bit transform that re quantifies the distinctions of a random variable in terms of bits so the Shannon entropy is the average number of binary distinctions or bits necessary to make all the distinctions of the random variable And using a linearization method all the set concepts in this logical information theory naturally extend to vector spaces in general and to Hilbert spaces in particular for quantum logical information theory which provides the natural measure of the distinctions made in quantum measurement Relatively short but dense in content this work can be a reference to researchers and graduate students doing investigations
