

SPECIES & ECOSYSTEM SURVIVAL

Every species plays a crucial role in the health and survival of its ecosystem. From food production to oxygen generation, pollination to seed dispersal, pest control, disease reduction, and waste recycling, each plant, animal and fungi is part of an intricate web of interconnected life.

Species roles are illustrated here using miombo woodland as an example – a forest type found across much of southern Africa.

1 Plants absorb carbon dioxide from the air and release oxygen that animals need to survive. Plants store carbon in their leaves, trunks and roots as well as in the soil around them. This reduces the amount of carbon dioxide entering the atmosphere and therefore helps reduce global warming. Plants help maintain water supplies by storing and releasing moisture, including floods and droughts.

2 Plants use energy from the sun, to convert carbon dioxide and water into glucose. This is the basis of food for almost all species in the world. Herbivores like elephants and antelopes eat plants and they can become food for carnivores like lions and wild dogs.

3 Flowering plants need to be pollinated to reproduce. Different species of insects, birds and mammals pollinate different plants. For example bats and moths pollinate baobab trees and many miombo species are pollinated by bees.

4 Many plants rely on animals to disperse their seeds, enabling new plants to grow. For example elephants, primates and birds eat fruit that disperses the seeds, fertilised by their dung, far from the parent plant.

5 Nature recycles everything, with many different species contributing to nutrient transfer. For example, dung beetles collect and bury faeces, cycling nutrients back into the soil. Millipedes feed on dead and decaying organic matter and transfer nutrients through their droppings.

6 Every species – including humans – contributes to ecosystem balance. Disrupting this balance can cause more negative consequences. For example, if natural habitat is reduced by humans, invasive animals like baboons and elephants may threaten existing people's farms, leading to community tensions. Disrupting habitat also increases the risk of disease transfer to humans.

7 There is a constant cycle of life and death, with many species helping dispose of dead matter, keeping the environment clean and healthy. For example vultures dispose of carcasses, helping prevent the spread of diseases like anthrax and rabies.

8 A healthy ecosystem has a balance of predators that keep pest populations under control. For example crocodiles eat fish and giraffes eat reeds, keeping their populations low. Many predators and omnivores reduce the number of sap-sucking insects such as mosquitoes and flies.

Ecology Science Of Survival:

Ecology Laurence Pringle, 1971 Summary An introduction to the basic principles of ecology such as natural cycles population patterns ecosystems biomes and natural and man made environmental changes **The Dialectics of Ecology** John Bellamy Foster, 2024-04 Today the fate of the earth as a home for humanity is in question and yet contends John Bellamy Foster the reunification of humanity and the earth remains possible if we are prepared to make revolutionary changes As with his prior books *The Dialectics of Ecology* is grounded in the contention that we are now faced with a concrete choice between ecological socialism and capitalist exterminism and rooted in insights drawn from the classical historical materialist tradition In this latest work Foster explores the complex theoretical debates that have arisen historically with respect to the dialectics of nature and society He then goes on to examine the current contradictions associated with the confrontation between capitalist extractivism and the financialization of nature on the one hand and the radical challenges to these represented by emergent visions of ecological civilization and planned degrowth on the other Education for Survival Dr. Gertrude G.
