Eye Muscles Accommodation: The Mystery Unveiled

In order to see properly the eyes must accommodate. Accommodation takes place when focusing on various distances close and far. Which muscles are doing the focusing during accommodation is debatable among ophthalmologists. Dr. Helmholtz, an early eye doctor, found that only the ciliary eye muscles do the accommodating. The Helmholtz Theory is the accepted belief of most modern eyeglass doctors. Dr. Bates, a natural eye specialist, felt that the two oblique eye muscles performed eye accommodation by compressing the round eyeball in the middle and making it longer horizontally. Dr. Bates cut these muscles in rabbits and found the eyes could not accommodate. When he injected a drug to paralyze the oblique muscles, the eyes failed to accommodate. When he put together the severed muscles and washed out the drug, the rabbit's eyes were able to accommodate again. The Helmholtz theory holds that accommodation is due to the expansion and contraction of the crystalline lens caused by the action of the ciliary muscle. Dr. Bates, through his experiments, discovered and proved that it is not the crystalline lens but the six external muscles that act upon the eyeball and give the eye its ability to adjust and accommodate to near and far objects. The fact that patients who have had the crystalline lens removed are still able to see and have the power to accommodate should be convincing proof of this theory. It is obvious both the oblique muscles and the ciliary muscles work in conjunction when focusing. Here is the reason why the normal eye when looking at a distant object becomes shortened and when looking at a close object is elongated. The external muscles, oblique, recti, iris, and the ciliary muscles all enable the eyes to accommodate properly. The external muscles lengthen and shorten the eyeball to enable light rays to fall upon the macula. The iris adjusts the pupil for the amount of light necessary to see clearly. And the ciliary muscle contracts the lens to focus upon the object. The ciliary muscle changes the lens and directs the rays of light to focus upon the macula or center of sight. While looking at a distant object of more than twenty feet away, the rays come into the eyes parallel. When looking at a close point, rays come into the eyes at an angle. The normal eye must accommodate these rays in order to see clearly a close or distant point. All rays from

International Handbook of Neuropsychological Rehabilitation Anne-Lise Christensen, Barbara P. Uzzell, 2013-04-17 I am extraordinarily pleased to have been asked by Drs Christensen and Uzzell to write the foreword for this handbook This handbook is the result of the most recent of a series of conferences held in Copenhagen Denmark at five year intervals over the past 15 years under the guidance and leadership of Dr Anne Lise Christensen and under the sponsorship of the Egmont Foundation which must be acknowledged as well for its constant support of this international effort The participants in these conferences are all internationally renowned clinicians and scientists These experts represent not only the area of neuropsychology but disciplines ranging from fundamental neurophysiology and neuroanatomy to medical and financial perspectives on neurological injury and recovery The participants have to a significant extent remained remarkably constant over this period and this has allowed increasing intimacy among them both professionally and personally One felicitous result of this camaraderie has been that the conferences have evolved with an increased focus on topics of the broadest interest across disciplines One aspect of such a continuing dialogue across disciplines is that specific areas of mutual interest are

Avital Schurr,Evelyne Gozal,2015-07-08 Glycolysis the pathway of enzymatic reactions responsible for the breakdown of glucose into two trioses and further into pyruvate or lactate was elucidated in 1940 For more than seven decades it has been taught precisely the way its sequence was proposed by Embden Meyerhof and Parnas Accordingly two outcomes of this pathway were proposed an aerobic glycolysis with pyruvate as its final product and an anaerobic glycolysis identical to the aerobic one except for an additional reaction where pyruvate is reduced to lactate Several studies in the 1980s have shown that both muscle and brain tissues can oxidize and utilize lactate as an energy substrate challenging this monocarboxylate s reputation as a useless end product of anaerobic glycolysis These findings were met with great skepticism about the idea that lactate could be playing a role in bioenergetics In the past quarter of a century monocarboxylate transporters MCTs were identified and localized in both cellular and mitochondrial membranes A lactate receptor has been identified Direct and indirect evidence now indicate that the enzyme lactate dehydrogenase LDH resides not only in the cytosol as part of the glycolytic pathway machinery but also in the mitochondrial outer membrane The mitochondrial form of the enzyme oxidizes lactate to pyruvate and concomitantly produces the reducing agent NADH These findings have shed light on a major drawback of the originally proposed aerobic version of the glycolytic pathway i e its inability to regenerate NAD as opposed to anaerobic glycolysis that features the cyclical ability of regenerating NAD upon pyruvate reduction to lactate by the cytosolic form of LDH The malate aspartate shuttle MAS a major redox shuttle in the brain was proposed as an alternative pathway for NAD generation for aerobic glycolysis Nonetheless would MAS really be necessary for that function if glycolysis always proceeds to the end products lactate and NAD An additional dilemma the originally proposed aerobic glycolysis presents has to do with the glycolytic pathway of erythrocytes which despite its highly aerobic environment always produces lactate as its end product It

is time to reexamine the original dogmatic separation of glycolysis into two distinct pathways and put to test the hypothesis of a unified singular pathway the end product of which is lactate the real substrate of the mitochondrial TCA cycle
