*Dynamic Soaring Dissected* Colin Taylor, 2023-01-26 *Dynamic Soaring Dissected* Albatrosses fly over the oceans in swooping curving flight gliding thousands of kilometres in search of food mostly without flapping their wings This is known as dynamic soaring which is the use of the energy of the horizontal wind to sustain speed and height It is different from the soaring flight of most other birds and gliders which use the vertical motion of the air to maintain or gain height Since the 1880 s a time before manned gliding flight had been achieved the mechanism of dynamic soaring has been poorly explained by the Rayleigh cycle or the wind gradient theory However there is more to dynamic soaring than the wind gradient and furthermore the true nature of albatross flight has only recently been revealed by filming and GPS tracking *Dynamic Soaring Dissected* takes up the discussion where it was left in the 19th century and explains how aircraft and birds fly It looks at albatross flight through the lens of electronic tracking and takes us on a foraging trip with an albatross in long distance soaring flight In the Windward Turn Theory it describes the mechanism of dynamic soaring and the hidden effect of the wind on a bird or an aircraft in flight It explains the way that albatrosses are able to turn this effect to their advantage and how they are able to dynamic soar crosswind upwind and downwind It also describes how radio control gliders can achieve huge speeds in circling flight and settles the perennial debate on the Myth of the Downwind Turn and what really happens when an aircraft turns downwind and ends up in a stall and spin accident

**Why Don't Jumbo Jets Flap Their Wings?** David Alexander, 2009-06-02 What do a bumble bee and a 747 jet have in common It s not a trick question The fact is they have quite a lot in common They both have wings They both fly And they re both ideally suited to it They just do it differently *Why Don t Jumbo Jets Flap Their Wings* offers a fascinating explanation of how nature and human engineers each arrived at powered flight What emerges is a highly readable account of two very different approaches to solving the same fundamental problems of moving through the air including lift thrust turning and landing The book traces the slow and deliberate evolutionary process of animal flight in birds bats and insects over millions of years and compares it to the directed efforts of human beings to create the aircraft over the course of a single century Among the many questions

the book answers Why are wings necessary for flight How do different wings fly differently When did flight evolve in animals What vision knowledge and technology was needed before humans could learn to fly Why are animals and aircrafts perfectly suited to the kind of flying they do David E Alexander first describes the basic properties of wings before launching into the diverse challenges of flight and the concepts of flight aerodynamics and control to present an integrated view that shows both why birds have historically had little influence on aeronautical engineering and exciting new areas of technology where engineers are successfully borrowing ideas from animals
