Cloud-Native Financial Data Engineering: Principles, Pipelines, and Scalable Architectures 2025 Author1:- ANOOP PURUSHOTAMAN, Author2:- PROF. DR M K SHARMA, PREFACE The financial services industry has undergone a profound transformation over the past decade From high frequency trading firms demanding millisecond level insights to retail banks seeking richer personalized customer analytics the scale velocity and variety of financial data have exploded Traditional on premises data warehouses and batch oriented ETL pipelines struggle to keep pace with today s requirements for real time risk monitoring fraud detection algorithmic trading signals and regulatory reporting In parallel the rise of cloud computing has unlocked virtually unlimited storage and compute capacity democratized access to sophisticated analytics tools and fostered an ecosystem of serverless and managed services designed for elasticity and resilience This book Cloud Native Financial Data Engineering Principles Pipelines and Scalable Architectures is born out of the need to bridge these trends It is written for data engineers architects and technology leaders who are tasked with designing and operating the next generation of financial data platforms Whether you are building a streaming pipeline to ingest market quotes an event driven system to detect anomalous trading patterns or a unified data lake that brings together transaction customer and risk data the cloud offers a paradigm shift you can focus on business logic and analytical value rather than on undifferentiated heavy lifting of infrastructure In the chapters that follow we first establish the foundational principles of cloud native data engineering in a financial context We examine how to decompose monolithic ETL workflows into micro services and pipelines how to embrace immutable append only event stores and how to design for failure and recovery at every layer We then explore the core building blocks of modern data architecture data ingestion patterns batch stream change data capture transformation frameworks serverless functions containerized jobs SQL on data lake metadata management and orchestration engines Along the way we emphasize best practices for security governance and cost optimization imperatives in a regulated risk averse industry Subsequent sections dive into specialized topics that address the unique demands of financial workloads We cover real time analytics use cases such as market data enrichment fraud signal propagation and credit scoring model deployment We unpack architectural patterns for high throughput low latency pipelines leveraging managed streaming platforms serverless compute column arithmetic engines and cloud native message buses We also address data quality and lineage at scale showing how to embed

continuous validation tests and visibility into every pipeline stage thereby ensuring that trading strategies and risk models rest on a bedrock of trusted data A recurring theme throughout this book is scalability both horizontal scalability of compute and storage and organizational scalability via self service data platforms We explore how to enable data as a product within your enterprise providing domain teams with curated discoverable datasets APIs and developer tooling so they can build analytics and machine learning solutions without reinventing ingestion pipelines or wrestling with infrastructure details This shift not only accelerates time to insight but also frees centralized engineering teams to focus on platform reliability cost governance and feature innovation By combining conceptual frameworks with concrete provider agnostic examples this book aims to be both a roadmap and a practical guide Wherever possible we illustrate patterns with code snippets and architectural diagrams while also pointing to managed services offered by leading cloud providers We encourage you to adapt these patterns to your organization s existing standards and to rigorously validate them within your security and compliance constraints As the lines between finance and technology continue to blur the ability to engineer data pipelines that are resilient elastic and observably sound becomes a strategic differentiator Whether you are modernizing a legacy data warehouse building a next gen risk platform or architecting a real time trading analytics engine the cloud native principles and patterns in this volume will equip you to deliver robust cost effective solutions that meet the exact demands of financial markets and regulatory bodies alike We extend our gratitude to the practitioners open source contributors and early adopters whose insights and feedback have shaped this book It is our hope that by sharing these learnings we collectively raise the bar for financial data engineering and help usher in an era where data driven decisions can be made with confidence speed and scale
