The pregnancy test shown here has four important areas along the paper wick. The urine or blood is applied on the far left and wicks to the right. The anti-hCG antibodies loosely attached to the paper are next. If the urine has hCG this binds to its antibody and travels along the paper as a complex. In the next area, a secondary antibody that only recognizes the hCG–primary antibody complex is firmly attached in a plus pattern. When the hCG complex binds to the secondary antibody, the detection system turns blue. The final spot is a different secondary antibody that recognizes the primary antibody without any hCG. This is a positive control, to ensure that the antibody was released and wicked up the paper with the urine.

Ganoderma Diseases of Perennial Crops J. Flood,P. D. Bridge,M. Holderness,2000 Annotation Diseases caused by Ganoderma species cause major losses of palms and other perennial crops throughout the world and these are particularly significant in Asia Successive replanting of crop monocultures can be rapidly exploited by soil borne fungi such as Ganoderma and the problem will become more serious in the 21st century as more areas become due for second or even third replanting Environmental considerations will reduce exploitation of new forest areas making further replanting of these crops inevitable Thus appropriate integrated management systems for these diseases are vital However the development of such control measures has been hampered in the past by a limited knowledge of the nature and inter relationships of populations of different hosts and the mechanisms of disease establishment and spread This book aims to address these limitations through enhanced knowledge of the biology and taxonomy of Ganoderma species The use of molecular and biochemical methods can be used to provide a greater understanding of the spread of the pathogen and consequently the improved management of disease
