**Religion and Mental Health** John F. Schumaker,1992 Some argue that religious beliefs foster security of mind and mental stability maintaining that they offer a sense of hope meaning and purpose provide a reassuring fatalism that enables the believer to better withstand suffering and pain and give people a sense of power and control through association with an omnipotent force Others assert however that religious beliefs can undermine mental health in ways that include generating excessive levels of guilt encouraging the unhealthy repression of anger and creating anxiety and fear with threats of punishment for sinful behavior This interdisciplinary collection presents previously unpublished papers on the controversial relationship between religious behavior and mental health Schumaker has assembled a distinguished international roster of contributors sociologists and anthropologists as well as psychiatrists and psychologists of religion representing a wide range of opinions concerning the mental health implications of religious belief and practice Taken together the papers provide a comprehensive overview of theory and research in the field Included are papers on the interaction of religion and self esteem life meaning and well being sexual and marital adjustment anxiety depression suicide psychoticism rationality self actualization and various patterns of anti social behavior Religion is also considered in relation to the mental health of women the elderly and children Contributions addressing mental health in non Western religious groups add an important cross cultural dimension to the volume

*Animal Pain* Ralph L Kitchell, Howard H Erickson, 2013-05-27 Pain is a complex physiological phenomenon it is hard to define satisfactorily in human beings and it is extremely difficult to recognize and interpret in animals Scientific knowledge concerning pain perception in animals must be obtained by drawing analogies based on comparative anatomy physiology and pathology and by inference based on subjective responses to pain experienced by humans Debate continues about whether animals of different species perceive pain similarly and whether any species perceives pain the same way humans do The use of animals in research in education and in testing products to minimize adverse effects requires more knowledge about pain perception in animals Increasing public concern about animal welfare has added urgency to this need Our knowledge of the scientific basis of the mechanisms of pain has advanced substantially in the last two decades Nociceptors or pain receptors are widespread in the skin and tissues of animals chemical mediation of nociceptor excitation may provide a key to understanding the peripheral phenomena related to pain The expression of pain in animals involves multiple ascending and descending branches as well as specialized pain signaling mechanisms in the spinal cord The importance of these different pathways varies with species and circumstances Endogenous neural systems in the brain stem and forebrain including both opioid and nonopioid mechanisms may modulate the central transmission of nociceptive signals in animals
