**Emerging Strategies in Neuroprotection** Manangos,Lal,2013-11-21 SOLOMON H SNYDER Receptor Research Reaches Neurology Relevance to Neurodegenerative Diseases and Stroke President George Bush has heralded the 1990s as the decade of the brain based largely on the rapid escalation of advances in the molecular neuro sciences and the likelihood that these will bear therapeutic fruit before the turn of the century There is little doubt that the 1970s and 1980s have witnessed more remarkable advances in the molecular neurosciences than all of the preceding hundred years Identification of receptor sites for drugs and neurotransmitters along with simple sensitive and specific means of monitoring them has made it possible to elucidate the mechanism of action for many known drugs and to identify new chemical entities as potential therapeutic agents At the same time the numbers of distinct neurotransmitters have multiplied Prior to 1970 only the biogenic amines were well accepted as transmitters The early 1970s witnessed the gradual acceptance of amino acids as major excitatory and inhibitory neurotransmitters Identification of opiate receptors and the subsequent identification of the enkephalins as their endogenous ligands led to an appreciation of peptides as putative transmitters and the accumulation of as many as a hundred neuropeptides by the decade s end In the 1980s the revolutions of molecular biology have been applied aggressively to the neurosciences with molecular cloning for neuropeptide precursors many important neurochemical enzymes and receptors for numerous transmitters
