factors in legume seeds and oilseeds M. Muzquiz, G.D. Hill, C. Burbano, C. Cuadrado, M.M. Pedrosa, 2023-08-28 This series of meetings bring together experts working in this field of Science from throughout the world A major feature of each conference session is an invited review which outlines the advances that have been made in a particular area since the last meeting A major factor that was considered at this meeting was the likely impact of plant genetic modification on the nutritional quality of their seeds for human and animal feeding As an example already a number of legume species and rapeseed have been modified to improve the sulphur amino acid content of their seed and thus their protein quality Besides the major grain legume species and rapeseed that had been discussed at previous meetings in this series number of crop

products as potential protein sources for animal feeding were considered for the first time These included cottonseed meal linseed meal and sunflower seed meal The potential of some new exotic crops from Mexico was also covered including Mexican species of the genus *Lupinus* and a Mexican plant from the same family as castor bean which has a very high oil content but is usually toxic Work from Cuba compared the nutritional characteristics of soybean with a range of tropical grain legume species which have received little previous attention A major change at this meeting was the greater consideration of the effects both positive and negative of the consumption of these seeds for human nutrition A major review on the development of allergenicity to legume seed in humans is included There was also consideration of the potential role of antinutritional factors in reducing the growth of various types of tumour cells The presented papers also suggest that the consumption of legume seed in the diet can potentially reduce serum cholesterol levels Overall from the 5 conference sessions there are 52 papers Of these 7 are major invited reviews on the current state of research in this important area for human and animal feeding

Nutritional Improvement of Food and Feed Proteins Mendel Friedman, 2013-03-09 The nutritional quality of a protein depends on the proportion of its amino acids especially the essential amino acids their physiological availability and the specific requirements of the consumer Availability varies and depends on protein source interaction with other dietary components and the consumer's age and physiological state In many foods especially those from plants low levels of various essential amino acids limits their nutritive value This is particularly important for cereals which may be inadequate in the essential amino acids isoleucine lysine threonine and tryptophan and legumes which are often poor sources of methionine Moreover these commodities are principle sources of protein for much of the earth's rapidly growing population At the current annual growth rate of about 2 percent the world population of about 4 billion will increase to 6.5 billion by the year 2000 and to 17 billion by the year 2050 Five hundred million people are presently estimated to suffer protein malnutrition with about fifteen thousand daily deaths The ratio of malnourished to adequately nourished will almost surely increase For these reasons and especially in view of the limited availability of high quality largely animal protein to feed present and future populations improvement of food and feed quality is especially important
