Seaweed Ecology and Physiology Christopher S. Lobban, Paul J. Harrison, 1994 A rewritten and re organised edition of The Physiological Ecology of Seaweeds 1985 Seaweed Ecology and Physiology surveys the broad literature but it is not merely an update of the earlier book This book contains an introductory chapter reviewing seaweed morphology cytology and life histories The chapter on community level ecology now includes six guest essays by senior algal ecologists which conveys the excitement of phycological research The treatment of tropical seaweeds had been expanded reflecting the growing literature from tropical regions and the authors experiences in the tropics The final chapter on mariculture is much larger and includes a case study on how principles of physiological ecology were applied in developing the carrageenan industry Finally there is an appendix summarising the taxonomic position and nomenclature of the species mentioned in the book

Evolution Mechanism and Control Method of Engineering Disasters Under Complex Environment Jianyong Han, Xiaoyu Bai, Zhongqiang Liu, Jae-Joon Song, Pengjiao Jia, 2025-03-03 As the result of resource exploitation and underground space

development the engineering disasters appear including landslides tunnel collapses earthquakes debris flow and urban facility failures which may lead to substantial economic damages and loss of lives The engineering challenges from the geotechnical engineering have attracted wide attention A large number of engineering disasters like water gushing sand inrush seepage damage gas leakage and gas explosion are triggered due to the complex environment such as high water or gas stress seepage effect and fluid solid interaction In order to control the engineering disaster the primary task to be solved is to reveal the engineering disaster initiation and evolution mechanism induced under complex environment

**Emerging zoonoses: eco-epidemiology, involved mechanisms and public health implications** Rubén Bueno-Marí,A. Paulo Gouveia Almeida,Juan Carlos Navarro,2015-07-06 Zoonoses are currently considered as one of the most important threats for public health worldwide Zoonoses can be defined as any disease or infection that is naturally transmissible from vertebrate or invertebrate animals to humans and vice versa Approximately 75% of recently emerging infectious diseases affecting humans are diseases of animal origin approximately 60% of all human pathogens are zoonotic All types of potential pathogenic agents including viruses parasites bacteria and fungi can cause these zoonotic infections From the wide range of potential vectors of zoonoses insects are probably those of major significance due to their abundance high plasticity and adaptability to different kinds of pathogens high degrees of synanthropism in several groups and difficulties to apply effective programs of population control Although ticks flies cockroaches bugs and fleas are excellent insects capable to transmit viruses parasites and bacteria undoubtedly mosquitoes are the most important disease vectors Mosquito borne diseases like malaria dengue equine encephalitis West Nile Mayaro or Chikungunya are zoonoses with increasing incidence in last years in tropical and temperate countries Vertebrates can also transmit serious zoonoses highlighting the role of some carnivorous animals in rabies dissemination or the spread of rodent borne diseases in several rural and urban areas Moreover the significance of other food borne zoonoses such as taeniasis trichinellosis or toxoplasmosis may not been underestimated According to WHO FAO and OIE guidelines an emerging zoonotic disease can be defined as a zoonosis that is newly recognized or newly evolved or that has occurred previously but shows an increase of incidence or expansion in geographical host or vector range There are many factors that can provoke or accelerate the emergence of zoonoses such as environmental changes habitat modifications variations of human and animal demography pathogens and vectors anomalous mobilization related with human practices and globalization deterioration of the strategies of vector control or changes in pathogen genetics To reduce public health risks from zoonoses is absolutely necessary to acquire an integrative perspective that includes the study of the complexity of interactions among humans animals and environment in order to be able to fight against these issues of primary interest for human health In any case although zoonoses represent significant public health threats many of them still remain as neglected diseases and consequently are not prioritized by some health international organisms
