Exterior Differential Systems And Equivalence Problems:

Exterior Differential Systems and Equivalence Problems Kichoon Yang, 1992-03-31 This monograph presents a concise yet elementary account of exterior differential system theory so that it can be quickly applied to problems The first part of the monograph Chapters 1 5 deals with the general theory the Cartan Kaehler theorem is proved the notions of involution and prolongation are carefully laid out quasi linear differential systems are examined in detail and explicit examples of the Spencer cohomology groups and the characteristic variety are given The second part of the monograph Chapters 6 and 7 deals with applications to problems in differential geometry the isometric embedding theorem of Cartan Janet and its various geometric ramifications are discussed a proof of the Andreotti Hill theorem on the O R embedding problem is given and embeddings of abstract projective structures are discussed For researchers and graduate students who would like a good introduction to exterior differential systems. This volume will also be particularly useful to those whose work involves differential geometry and partial differential equations Exterior Differential Systems Robert L. Bryant, S.S. Chern, Robert B. Gardner, Hubert L. Goldschmidt, P.A. Griffiths, 2013-06-29 This book gives a treatment of exterior differential systems It will in clude both the general theory and various applications An exterior differential system is a system of equations on a manifold defined by equating to zero a number of exterior differential forms. When all the forms are linear it is called a pfaffian system Our object is to study its integral manifolds i e submanifolds satisfying all the equations of the system A fundamental fact is that every equation implies the one obtained by exterior differentiation so that the complete set of equations associated to an exterior differential system constitutes a differential ideal in the algebra of all smooth forms Thus the theory is coordinate free and computations typically have an algebraic character however even when coordinates are used in intermediate steps the use of exterior algebra helps to efficiently guide the computations and as a consequence the treatment adapts well to geometrical and physical problems A system of partial differential equations with any number of inde pendent and dependent variables and involving partial derivatives of any order can be written as an exterior differential system In this case we are interested in integral manifolds on which certain coordinates remain independent The corresponding notion in exterior differential systems is the independence condition certain pfaffian forms remain linearly indepen dent Partial differential equations and exterior differential systems with an independence condition are essentially the same object Exterior Differential Systems and Equivalence Problems Kichoon Yang, 2013-03-14 This monograph presents a concise yet elementary account of exterior differential system theory so that it can be quickly applied to problems The first part of the monograph Chapters 1 5 deals with the general theory the Cartan Kaehler theorem is proved the notions of involution and prolongation are carefully laid out quasi linear differential systems are examined in detail and explicit examples of the Spencer cohomology groups and the characteristic variety are given The second part of the monograph Chapters 6 and 7 deals with applications to problems in differential geometry the isometric embedding theorem of Cartan

Janet and its various geometric ramifications are discussed a proof of the Andreotti Hill theorem on the O R embedding problem is given and embeddings of abstract projective structures are discussed For researchers and graduate students who would like a good introduction to exterior differential systems This volume will also be particularly useful to those whose work involves differential geometry and partial differential equations **Exterior Differential Systems and** Euler-Lagrange Partial Differential Equations Robert Bryant, Phillip Griffiths, Daniel Grossman, 2003-07 In Exterior Differential Systems the authors present the results of their ongoing development of a theory of the geometry of differential equations focusing especially on Lagrangians and Poincar Cartan forms They also cover certain aspects of the theory of exterior differential systems which provides the language and techniques for the entire study Because it plays a central role in uncovering geometric properties of differential equations the method of equivalence is particularly emphasized In addition the authors discuss conformally invariant systems at length including results on the classification and application of symmetries and conservation laws The book also covers the Second Variation Euler Lagrange PDE systems and higher order conservation laws This timely synthesis of partial differential equations and differential geometry will be of fundamental importance to both students and experienced researchers working in geometric analysis Geometric Approaches to **Differential Equations** Peter J. Vassiliou, Ian G. Lisle, 2000-03-13 A concise and accessible introduction to the wide range of topics in geometric approaches to differential equations Relativity and Scientific Computing Friedrich W Hehl, Roland A. Puntigam, Hanns Ruder, 2012-12-06 For this set of lectures we assumed that the reader has a reasonable back ground in physics and some knowledge of general relativity the modern theory of gravity in macrophysics and cosmology Computer methods are present ed by leading experts in the three main domains in numerics in computer algebra and in visualization The idea was that each of these subdisciplines is introduced by an extended set of main lectures and that each is conceived as being of comparable importance Therefore we believe that the book represents a good introduction into scientific I computing for any student who wants to specialize in relativity gravitation and or astrophysics. We took great care to select lecturers who teach in a comprehensible way and who are at the same time at the research front of their respective field In numerics we had the privilege of having a lecturer from the National Center for Supercomputing Applications NCSA Champaign IL USA and some from other leading institutions of the world visualization was taught by a visualization expert from Boeing and in computer algebra we took recourse to practitioners of different computer algebra systems as applied to classical general relativity up to quantum gravity and differential geometry <u>Using the Mathematics Literature</u> Kristine K.
