of Minimizers for the Mumford-Shah Functional Guy David, 2005-03-22 The Mumford Shah functional was introduced in the 1980s as a tool for automatic image segmentation but its study gave rise to many interesting questions of analysis and geometric measure theory The main object under scrutiny is a free boundary K where the minimizer may have jumps The book presents an extensive description of the known regularity properties of the singular sets K and the techniques to get them It is largely self contained and should be accessible to graduate students in analysis The core of the book is composed of regularity results that were proved in the last ten years and which are presented in a more detailed and unified way

Standard Monomial Theory V. Lakshmibai, K. N. Raghavan, 2007-12-23 Schubert varieties provide an inductive tool for studying flag varieties This book is mainly a detailed account of a particularly interesting instance of their occurrence namely

in relation to classical invariant theory More precisely it is about the connection between the first and second fundamental theorems of classical invariant theory on the one hand and standard monomial theory for Schubert varieties in certain special flag varieties on the other

Birational Geometry, Rational Curves, and Arithmetic Fedor Bogomolov, Brendan Hassett, Yuri Tschinkel, 2013-05-17 This book features recent developments in a rapidly growing area at the interface of higher dimensional birational geometry and arithmetic geometry It focuses on the geometry of spaces of rational curves with an emphasis on applications to arithmetic questions Classically arithmetic is the study of rational or integral solutions of diophantine equations and geometry is the study of lines and conics From the modern standpoint arithmetic is the study of rational and integral points on algebraic varieties over nonclosed fields A major insight of the 20th century was that arithmetic properties of an algebraic variety are tightly linked to the geometry of rational curves on the variety and how they vary in families This collection of solicited survey and research papers is intended to serve as an introduction for graduate students and researchers interested in entering the field and as a source of reference for experts working on related problems Topics that will be addressed include birational properties such as rationality unirationality and rational connectedness existence of rational curves in prescribed homology classes cones of rational curves on rationally connected and Calabi Yau varieties as well as related questions within the framework of the Minimal Model Program

Homogeneous Spaces and Equivariant Embeddings D.A. Timashev, 2011-04-06 Homogeneous spaces of linear algebraic groups lie at the crossroads of algebraic geometry theory of algebraic groups classical projective and enumerative geometry harmonic analysis and representation theory By standard reasons of algebraic geometry in order to solve various problems on a homogeneous space it is natural and helpful to compactify it while keeping track of the group action i e to consider equivariant completions or more generally open embeddings of a given homogeneous space Such equivariant embeddings are the subject of this book We focus on the classification of equivariant embeddings in terms of certain data of combinatorial nature the Luna Vust theory and description of various geometric and representation theoretic properties of these varieties based on these data The class of spherical varieties intensively studied during the last three decades is of special interest in the scope of this book Spherical varieties include many classical examples such as Grassmannians flag varieties and varieties of quadrics as well as well known toric varieties We have attempted to cover most of the important issues including the recent substantial progress obtained in and around the theory of spherical varieties

The Grassmannian Variety V. Lakshmibai, Justin Brown, 2015-09-25 This book gives a comprehensive treatment of the Grassmannian varieties and their Schubert subvarieties focusing on the geometric and representation theoretic aspects of Grassmannian varieties Research of Grassmannian varieties is centered at the crossroads of commutative algebra algebraic geometry representation theory and combinatorics Therefore this text uniquely presents an exciting playing field for graduate students and researchers in mathematics physics and computer science to expand their knowledge in the field of algebraic geometry The standard

monomial theory SMT for the Grassmannian varieties and their Schubert subvarieties are introduced and the text presents some important applications of SMT including the Cohen Macaulay property normality unique factoriality Gorenstein property singular loci of Schubert varieties toric degenerations of Schubert varieties and the relationship between Schubert varieties and classical invariant theory This text would serve well as a reference book for a graduate work on Grassmannian varieties and would be an excellent supplementary text for several courses including those in geometry of spherical varieties Schubert varieties advanced topics in geometric and differential topology representation theory of compact and reductive groups Lie theory toric varieties geometric representation theory and singularity theory The reader should have some familiarity with commutative algebra and algebraic geometry

Enriques Surfaces I François Cossec,Igor

Dolgachev,Christian Liedtke,2025-05-21 This book consisting of two volumes gives a contemporary account of the study of the class of projective algebraic surfaces known as Enriques surfaces These surfaces were discovered more than 125 years by F Enriques in an attempt to extend the characterization of rational algebraic curves to the case of algebraic surfaces The novel feature of the present exposition is that no assumption on the characteristic of the ground field is assumed This requirement calls for exploring the geometry of such surfaces by purely geometric and arithmetic methods that do not rely on transcendental methods such as the theory of periods of algebraic surfaces of type K3 which are close relatives of Enriques surfaces Some of the methods use many technical tools from algebraic geometry that are discussed in Volume 1 and may be a useful source of references for the study of algebraic surfaces over fields of positive characteristic Volume 1 also contains a detailed exposition of the theory of elliptic surfaces over fields of arbitrary characteristic The first volume is an essential and greatly extended revision of Enriques Surfaces I published in 1989 by Birkh user and co authored by F Cossec and I Dolgachev Included is a new chapter devoted to the theory of moduli of Enriques surfaces The two volumes together contain many examples and an extensive bibliography made up of more than 700 items
