Nadadur,John W. Hollingsworth,2015-05-06 Exposure to ambient air pollutants both indoors and outdoors has been associated with the exacerbation and also in the etiology of diverse human diseases This book offers an overview of our current understanding of air pollution health risks and how this knowledge is being used in the regulatory therapeutic intervention measures to protect the public health and reduce the disease burden caused by acute and long term exposure to air pollutants Air Pollution and Health Effects provides readers with a comprehensive understanding of air pollution health risks morbidity and the global disease burden whilst also delivering critical review on state of the art research so as to gain a fundamental understanding of the biological mechanisms involved in the etiology of air pollution induced diseases Chapters range from pregnancy outcomes and pre term birth carcinogens in the ambient aerosol and the health consequences of indoor biomass burning Special emphasis is placed on regional and local air pollution and its impact on global health along with suitable preventive and interventional measures With contributions from international experts in the field this volume is a valuable guide for researchers and clinicians in toxicology medicine and public health as well as industry and government regulatory scientists involved in health protection

Monitoring Ambient Air Quality for Health Impact Assessment World Health Organization. Regional Office for Europe,1999 A guide to the principles and methods of air quality assessment aimed at measuring population exposure to ambient air pollutants and estimating the effects on health Addressed to policy makers as well as scientists engaged in air quality monitoring the book responds to the failure of most monitoring systems to provide data that are useful in estimating and managing threats to health The need for exposure data on populations at special risk is also addressed Throughout emphasis is placed on methods of monitoring and modelling that are cost effective targeted and appropriate to local and national conditions The report has six chapters The first introduces WHO activities related to air quality management and explains the need for monitoring systems capable of assessing health impact The types of information required for health impact assessment are described in chapter two which outlines several methods of monitoring and modelling that can be used to measure the level and distribution of exposure to air pollutants in populations identify population groups with high exposure and estimate adverse effects on health Chapter three formulates a general concept of air quality assessment offering advice on principles for designing a monitoring network interpreting and reporting data and solving problems with quality assurance Also included is a comparison of the advantages disadvantages and costs of different methods for air quality monitoring Against this background the fourth and most extensive chapter describes specific methods for the

monitoring of carbon monoxide ozone sulfur dioxide nitrogen dioxide particulate matter benzene polycyclic aromatic hydrocarbons lead and atmospheric cadmium Monitoring strategies for each pollutant are presented according to a standard format which covers health effects sources and exposure patterns monitoring methods recommended strategies for monitoring and assessment and a practical example The remaining chapters offer advice on the collation analysis interpretation and dissemination of data and summarize the main conclusions and recommendations of the report Detailed technical guidelines for the use of various methods and models are provided in a series of annexes The report also reproduces the newly revised WHO air quality guidelines for Europe

Area of Sustainable Development and Environmental Health, 2005 **Vehicular Air Pollution** Bekir Onursal, Surhid Gautam, 1997-01-01 Much is expected of private financing to help meet the infrastructure requirements of the rapidly growing East Asian economies Although private financing grew briskly during the 1990s it represents only a small share of all infrastructure investment in the region between 12 and 18 percent This monograph draws on experience in a number of countries in East Asia as well as Australia Chile and India to analyze the impediments to and prospects for private financing of infrastructure The chapters discuss the choices available to policymakers and the strategies that governments have followed An overview chapter describes recent trends in international financing of infrastructure projects in the region discusses the key policy and institutional impediments to greater private participation and assesses the role of domestic capital markets and finance It also outlines a national and regional strategy for stimulating private investment in infrastructure The case studies from countries outside East Asia illustrate the payoffs of increased integration and concerted moves toward private provision of infrastructure

**Longitudinal Study on the Acute Effects of Ambient Air Pollution in Congestive Heart Failure** Stéphane Buteau, 2018 People suffering from congestive heart failure CHF may be at higher risk for the acute effects of air pollution The purpose of this dissertation was to investigate the acute effects of ambient air pollution in persons having CHF by making use of an innovative population based longitudinal study design that can address limitations of previous epidemiological air pollution studies using grouped analysis notably by incorporating medical histories of subjects throughout the follow up and spatially resolved time dependent daily exposures to air pollution at subjects residence This dissertation includes three original studies The first study is a structured review of panel studies that investigated the effect of ambient air pollutants PM<sub>2.5</sub> NO<sub>2</sub> O<sub>3</sub> on selected indices of HRV that reflect the activity of the autonomic nervous system one important postulated mechanism linking air pollution and acute health events Many of the 33 selected studies differed substantially in terms of design characteristics and statistical methodologies thus limiting the possibility of pooling studies I

was not persuaded by the results that there was an association between PM<sub>2.5</sub> and any of the four indices of HRV investigated whereas for NO<sub>2</sub> and O<sub>3</sub> the number of high quality studies was insufficient to draw definite conclusions. Panel studies with improved designs and methodologies are needed to establish or refute an association between ambient exposure to air pollution and HRV. The second study presents the development and comparison of spatially resolved daily concentrations of NO<sub>2</sub> and O<sub>3</sub> predicted for areas defined by the first three characters of the postal codes in Montreal 1991–2003 using different spatiotemporal models. For both pollutants the results showed that the method used may lead to substantial differences in the daily mean concentrations assigned to a postal code area on a given day. The back extrapolation method, which was the only method incorporating data from dense exposure surveys, showed a higher degree of disagreement with the other methods that were all constrained by the sparse monitoring network. In view of these substantial differences, the analyses of the health effects from air pollution should make use of multiple exposure models. The third study is a longitudinal cohort study developed from administrative health databases in elderly having CHF in Montreal 1991–2003 to estimate 1) whether non-accidental mortality was associated with spatially resolved daily exposures to ambient NO<sub>2</sub> and O<sub>3</sub> and 2) whether these associations were modified according to a complication or worsening in a person's health. I used two distinct statistical designs: a case crossover that contrasts the same person at different times and a nested case control that contrasts different persons at similar times. The effects of air pollution and weather on mortality were modelled using distributed lag nonlinear models over lags 0–3 days. I found that the estimates of risk depended on the exposure method and the statistical design used. Using the back extrapolation method, which likely provides the better estimates of exposure for the case crossover, the cumulative mean percentage changes (MPC) in daily mortality per interquartile increment in NO<sub>2</sub> 8.8 ppb was 3.0% (95% CI 0.4–6.6%) and for O<sub>3</sub> 16.5 ppb 3.5% (95% CI 4.5–12.1%). For the nested case control, the cumulative MPC in daily mortality was 2.9% (95% CI 0.9–6.9%) for NO<sub>2</sub> and 7.3% (95% CI 3.0–11.9%) for O<sub>3</sub>. In the nested case control but not in the case crossover, I found evidence of effect modification according to the prescribed dose of furosemide, which is a diuretic used to treat CHF. This study strengthens the evidence that daily exposure to air pollution may increase the risk of daily mortality in CHF. The unique design and modeling framework illustrated in this study can form the basis of future investigations on the acute effects of air pollution.
