**Statistical Thermodynamics of Nonequilibrium Processes** Joel Keizer, 1987-07-21 The structure of the theory of thermodynamics has changed enormously since its inception in the middle of the nineteenth century Shortly after Thomson and Clausius enunciated their versions of the Second Law Clausius Maxwell and Boltzmann began actively pursuing the molecular basis of thermodynamics work that culminated in the Boltzmann equation and the theory of transport processes in dilute gases Much later Onsager undertook

the elucidation of the symmetry of transport coefficients and thereby established himself as the father of the theory of nonequilibrium thermodynamics. Combining the statistical ideas of Gibbs and Langevin with the phenomenological transport equations, Onsager and others went on to develop a consistent statistical theory of irreversible processes. The power of that theory is in its ability to relate measurable quantities such as transport coefficients and thermodynamic derivatives to the results of experimental measurements. As powerful as that theory is, it is linear and limited in validity to a neighborhood of equilibrium. In recent years it has been possible to extend the statistical theory of nonequilibrium processes to include nonlinear effects. The modern theory as expounded in this book is applicable to a wide variety of systems both close to and far from equilibrium. The theory is based on the notion of elementary molecular processes which manifest themselves as random changes in the extensive variables characterizing a system. The theory has a hierarchical character and thus can be applied at various levels of molecular detail. Applied Mechanics Reviews, 1973

**PRINCIPLES OF MASS TRANSFER** KAL RENGANATHAN SHARMA, 2007-01-21. This book addresses the specific needs of undergraduate chemical engineering students for the two courses in Mass Transfer I and Mass Transfer II. It is also suitable for a course in Downstream Processing for biotechnology students. This self-contained textbook is designed to provide single volume coverage of the full spectrum of techniques for chemical separations. The operations covered include vapour distillation, fluid adsorption, gas absorption, liquid extraction, solid leaching, gas humidification, solid drying, foam separation, solution crystallization, metal alloying, reverse osmosis, molecular sieves, electrodialysis, and ion exchange. The text also discusses emerging applications such as drug delivery, gel electrophoresis, bleaching, membrane separations, polymer devolatilization, solution crystallization, and gas chromatography. Equipment selection is discussed for different operations. A table of industrial applications for each and every mass transfer unit operation is provided. The worked examples illustrate problems from chemical process and biotechnology industries. Review questions encourage critical thinking and end-of-chapter problems emphasize grasping of the fundamentals as well as illustrate applications of theory to a wide variety of scenarios. **KEY FEATURES** Includes several case studies ranging from manufacture of vitamin C, prilling tower to granulate urea to vanaspati discoloration and wilting of the lettuce. Introduces generalized Fick's law of diffusion. Discusses hollow fibre mass exchangers. Introduces new concepts such as cosolvent factor, Z-step procedure for multistage cross-current extraction. Food Process Engineering Explained Anagh Deshpande, 2024-12-15. Food Process Engineering Explained addresses the growing need for cleaner and healthier food in response to a rising population. The book explores recent advancements in the food processing industry and technology covering production, processing, packaging, storage, and cooking techniques to ensure and preserve food quality, taste, and aesthetic value.
