Complementarity Modeling in Energy Markets Steven A. Gabriel, Antonio J. Conejo, J. David Fuller, Benjamin F. Hobbs, Carlos Ruiz, 2012-07-20 This addition to the ISOR series introduces complementarity models in a straightforward and approachable manner and uses them to carry out an in depth analysis of energy markets including formulation issues and solution techniques In a nutshell complementarity models generalize a optimization problems via their Karush Kuhn Tucker conditions b on cooperative games in which each player may be solving a separate but related optimization problem with potentially overall system constraints e g market clearing conditions c economic and engineering problems that aren't specifically derived from optimization problems e g spatial price equilibria d problems in which both primal and dual variables prices appear in the original formulation e g The National Energy Modeling System NEMS or its precursor PIES As such complementarity models are a very general and flexible modeling format A natural question is why concentrate on energy markets for this complementarity approach s it turns out energy or other markets that have game theoretic aspects are best

modeled by complementarity problems The reason is that the traditional perfect competition approach no longer applies due to deregulation and restructuring of these markets and thus the corresponding optimization problems may no longer hold Also in some instances it is important in the original model formulation to involve both primal variables e g production as well as dual variables e g market prices for public and private sector energy planning Traditional optimization problems can not directly handle this mixing of primal and dual variables but complementarity models can and this makes them all that more effective for decision makers
