**Supramolecular Chemistry** Doris Grants, Supramolecular chemistry is a fascinating branch of chemistry that focuses on the study of non covalent interactions between molecules Unlike traditional chemistry which revolves around the formation of covalent bonds between atoms supramolecular chemistry investigates how molecules interact with each other through weaker forces such as hydrogen bonds van der Waals forces ionic interactions and stacking This field offers a deeper understanding of how molecules can form complex assemblies and structures without the need for direct chemical bonding The concept of supramolecular chemistry was first introduced by Jean Marie Lehn Donald J Cram and Charles J Pedersen who were awarded the Nobel Prize in Chemistry in 1987 for their pioneering work They developed the concept of molecular recognition where specific molecules can recognize and bind to each other much like a lock and key This phenomenon has opened up a wide array of possibilities for creating new materials sensors and even systems that mimic biological processes Supramolecular chemistry is not only about the study of individual interactions between molecules but also about understanding how these interactions can lead to the self assembly of complex structures These structures can range from simple aggregates to large intricate molecular machines and materials The ability of molecules to self organize into functional systems is one of the most remarkable aspects of supramolecular chemistry and it has led to numerous applications in fields such as nanotechnology drug delivery and materials science

**Carbon Dioxide Electrochemistry** Marc Robert, Cyrille Costentin, Kim Daasbjerg, 2020-10-14 Conversion of light and electricity to chemicals is an important component of a sustainable energy system The exponential growth in renewable energy generation implies that there will be strong market pull for chemical energy storage technology in the near future and here carbon dioxide utilization must play a central role The electrochemical conversion of carbon dioxide is key in achieving these goals Carbon Dioxide Electrochemistry showcases different advances in the field and bridges the two worlds of homogeneous and heterogeneous catalysis that are often perceived as in competition in research Chapters cover homogeneous and heterogeneous electrochemical reduction of CO<sub>2</sub> nanostructures for CO<sub>2</sub> reduction hybrid systems for CO<sub>2</sub> conversion electrochemical reactors theoretical approaches to catalytic reduction of CO<sub>2</sub> and photoelectrodes for electrochemical conversion With internationally well known editors and authors this book will appeal to graduate students and researchers in energy catalysis chemical engineering and chemistry who work on carbon dioxide

**Catalysis at Surfaces** Wolfgang Grünert, Wolfgang Kleist, Martin Muhler, 2023-07-24 Catalysis is at the heart of

the chemical industry which uses solid catalysts for the large scale production of commodity chemicals Catalysis at surfaces is also the basis for the ongoing transition to a sustainable energy supply which requires molecules such as hydrogen ammonia or methanol to store energy in chemical bonds and environmental protection equally relies on heterogeneous catalysis Catalysis at surfaces is a truly interdisciplinary field which requires profound knowledge from chemistry physics and engineering as provided by this textbook All essential tools are described ranging from the synthesis and modification of porous solids over bulk and surface sensitive characterization techniques to currently applied theoretical methods A close up to the important aspects of surface catalysis is provided which comprises the established knowledge about mechanisms and active sites promoters and poisons in redox and acid base catalysis This advanced textbook is recommended for Master and PhD students for whom it provides the fundamentals and all relevant aspects of catalyst synthesis characterization and application in suitable reactors It is not only thermal catalysis that is covered in depth but also photo and electrocatalysis as emerging fields in the Energiewende
