John Hughlings Jackson Samuel H. Greenblatt,2021-12-23 John Hughlings Jackson 1835 1911 was a preeminent British neurologist who is widely recognized today as one of the leading founders of modern clinical neurology and neuroscience He had a unique ability to translate messy clinical data into viable neuroscientific conceptions This ability served him well because in his early years knowledge of cerebral organization was quite rudimentary Jean Martin Charcot 1825 1893 faced the same problem at the same time in the 1860s and each man recognized the other s work at a fundamental level Although Jackson s historical standing has increased over the century since his death there is only one full length biography the Critchleys John Hughlings Jackson Father of English Neurology OUP 1998 Like the numerous articles and chapters that have been written about Jackson that book is sometimes inaccurate and often hagiographic In this new biography John Hughlings Jackson Clinical Neurology Evolution and Victorian Brain Science Samuel H Greenblatt provides a critical analysis of Jackson s work within the professional social and intellectual contexts of his Victorian milieu The book follows Jackson s intellectual development through a close examination of his published writings in chronological order from the case reports and Suggestions of his early medical career to the major lectures he delivered in his later years The text is supplemented with a comprehensive bibliography of Jackson s writings that will be of practical use to scholars of his work

Reembedding Translation Process Research Ricardo Muñoz Martín,2016-10-03 Reembedding Translation Process Research is a rich collection of empirical research papers investigating important new facets of the relationship between translation and cognition The common thread running through the collection is the notion of re embedding the acts of translating and interpreting and the ways we understand them That is they all aim to re situate these acts within what we now know about the brain the powerful relationship of brain and body and the complex interaction between cognition and the environment in which it is embedded Each chapter focuses on a particular aspect of the overall notion of re embedding thereby expanding the breadth of empirical research about translating This book refuses Descartes distinction between mind and brain and reaffirms the highly dynamic emergent and interactive nature of cognitive processes in translation The overarching conclusion is that translation studies should reconsider re embed any model of translation processes that arises without properly accommodating the interdependence of brain body and environment in the emergence of cognition

urgencies and emergencies that can occur One of the very attractive features of the field of movement disorders is that diagnosis is often based on unique visible and sometimes audible phenomenological symptoms and signs Therefore in this era of highly sophisticated laboratory and radiological diagnostic tools the diagnosis of many movement disorders is still largely made in the clinic where pattern recognition is key Crucial to astute clinical diagnosis is broad clinical experience In short you have to have seen one to recognize one Patients with movement disorders nearly always present as outpatients but as aptly recognized by Drs Frucht and Fahn this may include acute manifestations leading to emergency presentations often in an emergency room setting where they are very likely to be unrecognized and therefore poorly managed The authors define an emergency movement disorder as one in which failure to promptly diagnose and treat may result in significant morbidity or mortality However they also stress the importance of certain can't miss diagnoses such as Wilson's disease dopa responsive dystonia and Whipple's disease in which delayed diagnosis in less emergent situations can lead to slowly evolving and often irreversible neurological damage with tragic consequences
