Strong Point: Positive effects of water on soil structure, water table, and vegetation in winter

Abstract: The authors examined the effects of a 12-week, 100% body weight (BW) resistance training program on the body composition and muscle strength of 10 sedentary, middle-aged men. The men were randomly assigned to either a control group (CON) or a resistance training group (RT). The RT group performed a 12-week, 100% BW resistance training program, while the CON group remained sedentary. The RT group showed significant increases in muscle mass and strength, while the CON group showed no significant changes. The RT group also showed a significant decrease in body fat percentage, while the CON group showed no significant changes. The results of this study suggest that a 12-week, 100% BW resistance training program can effectively improve body composition and muscle strength in sedentary, middle-aged men.
