at least three program committee members many of whom called upon additional reviewers *Data Structures for Raster Graphics* Laurens R.A. Kessener, Frans J. Peters, Marloes L.P. van Lierop, 2012-12-06 Raster graphics differs from the more traditional vector or line graphics in the sense that images are not made up from line segments but from discrete elements orderly arranged in a two dimensional rectangular region There are two reasons for the growing popularity of raster graphics or bit mapped displays 1 the possibilities they offer to show extremely realistic pictures 2 the dropping prices of those displays and associated processors and memories With the rise of raster graphics all kinds of new techniques methods algorithms and data representations are associated such as ray tracing raster operations and quadtrees bringing with them a lot of fruitful research As stated above raster graphics allows to create extremely realistic synthesized pictures There are important applications in such diverse areas as industrial design flight simulation education image processing and animation Unfortunately many applications are hampered by the fact that with the present state of the art they require an excessive amount of computing resources Hence it is worthwhile to investigate methods and techniques which may be of help in reducing computer costs associated with raster graphics applications Since the choice of data structures influences the efficiency of algorithms in a crucial way a workshop was set up in order to bring together a limited number of experienced researchers to discuss this topic The workshop was held from 24 to 28 June 1985 at Steensel a tiny village in the neighbourhood of Eindhoven the Netherlands Data Structures & Algorithm Analysis in C++ Clifford A.
