Zhmakin, 2025-07-23 This monograph discusses the physical phenomena encountered in the heat transfer in living tissues and mathematical models It also considers all the relevant information regarding heat transfer in humans animals and plants in nature and medicine from the whole body down to cellular and sub cellular models Effects of the high or low temperature on the biological systems at the different levels cells tissues and organisms as well a role of the blood circulation and the structure of the vascular network on the heat transfer are considered The classic Pennes bioheat equation a number of the non Fourier heat transfer models including the single phase lag and dual phase lag models the porous media models the models based on the fractional differential equations the discrete vascular models are analyzed and discussed at length This book is particularly interesting for graduate students postdoctoral fellows and researching working on heat transfer in biological systems **National Library of Medicine Current Catalog** National Library of Medicine (U.S.), **Selected Papers of Abdus Salam** Abdus Salam, Ahmed Ali, 1994 This is a selection from over 250 papers published by Abdus Salam Professor Salam has been Professor of Theoretical Physics at Imperial College London and

Director of the International Centre for Theoretical Physics in Trieste for which he was largely responsible for creating. He is one of the most distinguished theoretical physicists of his generation and won the Nobel Prize for Physics in 1979 for his work on the unification of electromagnetic and weak interactions. He is well known for his deep interest in the development of scientific research in the third world to which ICTP is devoted and has taken a leading part in setting up the Third World Academy. His research work has ranged widely over quantum field theory and all aspects of the theory of elementary particles and more recently into other fields including high temperature superconductivity and theoretical biology. The papers selected represent a cross section of his work covering the entire period of 50 years from his student days to the present.

Introduction to Proteins and Protein Engineering Barry Robson, Jean Garnier, 1988. The desire to understand protein structure has been given new impetus by the explosive growth of biotechnology and the important role of proteins, natural and modified, in this technology. Protein molecules are machines and protein engineering is opening up a whole new world of machinery on the molecular scale. This work is a simple but in many ways detailed introduction to current knowledge, techniques and applications. The volume is essentially in two parts: the first half covering a basic introduction to proteins appropriate at the undergraduate and early postgraduate level which will prove a valuable teaching aid. The second half is a more advanced guide to concepts and methods covering a range of aspects not previously collected in one volume. It will serve as a background reader and guide for advanced research study. **Meteorologii i Hidrologii**, 1990. Introduction to Molecular Biology S. Bresler, 2012-12-02. Introduction to Molecular Biology focuses on the principles of polymer physics and chemistry and their applications to fundamental phenomena in biological sciences. It examines the structure, synthesis and function of nucleic acids and proteins as well as the physicochemical techniques necessary in determining the macromolecular structure, the kinetics and mechanism of enzyme action, the genetics of bacteria and their viruses and the genetic code. It also considers the importance of precise quantitative analysis in biochemistry and biophysics, the architecture and function of biological macromolecules and the unique mechanisms that regulate the cell's biological activity. Organized into five chapters, this book

begins with an overview of proteins and their functional activity from contractility and enzymatic catalysis to immunological activity formation of selectively permeable membranes and reversible binding and transport It explains how such functions are related to molecular interactions and therefore fall within the purview of molecular biology The book then proceeds with a discussion on the chemical structure of proteins and nucleic acids the physicochemical techniques in measuring molecular size and shape the mechanism of enzymatic reactions the functions of DNA and RNA and the mechanism of phase transition in polynucleotides This book is intended for both biologists and non biologists who want to be acquainted with the advances made in molecular biology molecular genetics and molecular biophysics during the 1950s and 1960s **Biologist** ,1985
