

Endocytosis: Clathrin-coated vesicles

Secretory Pathway-dependent Endocytosis

Secretory pathway-dependent endocytosis is a type of endocytosis that involves the formation of clathrin-coated vesicles (CCVs) from the plasma membrane.

This process is regulated by the presence of specific cargo molecules in the plasma membrane, which are recognized by adaptor proteins that initiate the formation of the CCV.

Secretory pathway-dependent endocytosis is involved in the regulation of cell surface receptors and the transport of signaling molecules into the cell.

It is a key component of the endocytic pathway, which is responsible for the internalization and degradation of extracellular material.
