3e Martin Stopford,2008-12-19 Combining a sophisticated historical and theoretical analysis of the shipping industry with a practical explanation of all aspects of the shipping industry this third edition is essential reading for students and professionals with an interest in this area **Tankers in Trouble** Stig Tenold,2017-10-18 This book analyses the causes and effects of the shipping market crisis in the 1970s and 1980s the most severe of the twentieth century It approaches the subject from three viewpoints The first is the tanker sector where the crisis began spread and caused the most damage The second is from a national perspective focusing on the impact on Norwegian shipping and shipowners The third narrowed further in scope analyses the crisis from the business perspective of four individual tanker owners taking into account their business strategies and eventual fates The aim of the journal is to add to the knowledge of recent maritime history by examining the transformation of the industry during a period of rapid change One distinct conclusion is that shipowners to their detriment assumed that the demand for tankers would continue to increase as it had consistently done so throughout the century thus far The overall conclusion is that shipping is a cyclical industry and that the oversupply of ships produced during the 1970s took its toll toward the end of the century By 2004 and 2005 however the industry began to bounce back offering hope for the future The book consists of an introductory chapter seven chapters of analysis a concluding chapter select bibliography and three appendices tabling Norwegian tanker statistics **Maritime Economics** E. Karakitsos,L. Varnavides,2014-06-24 This book analyses shipping markets and their interdependence This ground breaking text develops a new macroeconomic approach to maritime economics and provides the reader with a more comprehensive understanding of the way modern shipping markets function **Economic Progress and Growth** H.M. Scobie,2013-03-07 This volume puts forward a group of models applied to different economies capturing the progress and growth of their economic systems The

models provide a quantified framework for the formulation of economic policy They aid the introduction of targets and policy instruments taking account of constraints in the process of development Also an evaluation of external and internal shocks is taken using a comparative static type of analysis The models take into account constraints which are in the nature of institutional as well as supply constraints Problems of data exist in any quantitative analysis and account was taken of this factor in presenting the models and the results reached Nonetheless the models attempt to specify estimate and simulate a given macroeconomic system Models of this type are not freely available to the interested reader but only in a fragmented way This book puts the efforts of a group of economists worldwide under one cover It is believed that the collection will be of interest both for courses in planning and for those advising these countries such as international organizations research bodies etc Moreover an overview of trade policy and income distributional factors is presented It is hoped that this collection will prove interesting and useful to economists world wide

Dynamic Modelling Alisson Brito, 2010-01-01 When talking about modelling it is natural to talk about simulation Simulation is the imitation of the operation of a real world process or systems over time The objective is to generate a history of the model and the observation of that history helps us understand how the real world system works not necessarily involving the real world into this process A system or process model takes the form of a set of assumptions concerning its operation In a model mathematical and logical assumptions are considered and entities and their relationship are delimited The objective of a model and its respective simulation is to answer a vast number of what if questions Some questions answered in this book are What if the power distribution system does not work as expected What if the produced ships were not able to transport all the demanded containers through the Yangtze River in China And what if an installed wind farm does not produce the expected amount of energy? Answering these questions without a dynamic simulation model could be extremely expensive or even impossible in some cases and this book aims to present possible solutions to these problems
