Fertilizer application can increase crop yields and improve global food security and thus has the potential to eliminate hunger and poverty However excessive amounts of fertilizer application can contribute to groundwater pollution greenhouse gas emissions eutrophication deposition and disruptions to natural ecosystems and soil acidification over time Small farmers in many countries think inorganic fertilizers are expensive and degrade soils and thus policymakers want to promote organic instead of inorganic fertilizers To develop practical fertilizer recommendations for farmers yield responses to applied fertilizers from inorganic and organic sources indigenous nutrient supply from soil and nutrient use efficiency require consideration There is a lack of sufficient scientific understanding regarding the need and benefit of integrated nutrient management i e judicious use of inorganic and organic sources of nutrients to meet the nutrient demand of high yielding crops increase yields and profits and reduce soil and environmental degradation Inadequate knowledge has constrained efforts to develop precision nutrient management recommendations that aim to rationalize input costs increase yields and profits and reduce environmental externalities This Special Issue of the journal provided some evidence of the usefulness of integrated nutrient management to sustain soil resources and supply nutrients to crops grown with major cereal and legume crops in some developing countries *Crop Yield Response to Fertilizer in the United States* Donald Bryan Ibach,James

Alleviating Soil Fertility Constraints to Increased Crop Production in West Africa A. Uzo Mokwunye, 2012-12-06 Tropical Africa escaped from the glaciers that covered the temperate parts of the world during the Ice Age The legacy is that most of the parent materials of the soils of tropical Africa are old highly weathered and devoid of bases and phosphate bearing minerals Traditional farming systems which were relatively stable and sustainable relied on long fallow periods after one to two years of cropping to maintain the productive capacity of the soils In recent times and especially in densely populated areas a sizeable class of landless farmers have begun to cultivate marginal lands or to invade the forest reserves thereby exacerbating the problems of land and environmental degradation of soil fertility that will facilitate the production of adequate quantities of the principle Maintaining a level staples has become a major challenge to agricultural scientists in tropical Africa To increase the nutrient supplying power of soils requires the inputs of fertilizers These can be organic or inorganic The efficiency with which these externally supplied inputs can increase agricultural production and reduce soil and environmental deterioration is dependent on the ability of scientists to determine the right types and quantities of the products to apply to each soil crop and cropping system as well as the ability of farmers to acquire requisite farm management skills

Efficient Nitrogen Fertilizer Management to Improve Crop Production Li Wang, Ying

Zhao,Jianwei Lu,2024-05-22 The improvement in global crop production over the past several decades has been associated with increased use of nitrogen N fertilizer However on average less than 50% of the nitrogen added to croplands globally is harvested as crop product Inefficient use of N fertilizer by crops will result in substantial agricultural nitrogen losses posing threats to human and ecosystem health Crop production must increase dramatically to meet the growing demand for food and biofuels projected for 2050 To boost crop yield with lowered environmental cost the use of high potential crop cultivars and efficient nitrogen fertilizer management are required Recent advances in N management practices such as enhanced efficiency fertilizer use improved manure management and machine deep placement of fertilizer have opened up new strategies to achieve improved crop production with N use reduction A better understanding of the key crop traits and regulatory processes in response to N fertilizer managements will facilitate the increase in crop yield N use efficiency while minimizing impacts on the environment
