*Hearing Loss* National Research Council, Division of Behavioral and Social Sciences and Education, Board on Behavioral, Cognitive, and Sensory Sciences, Committee on Disability Determination for Individuals with Hearing Impairments, 2004-12-17. Millions of Americans experience some degree of hearing loss. The Social Security Administration (SSA) operates programs that provide cash disability benefits to people with permanent impairments like hearing loss if they can show that their impairments meet stringent SSA criteria and their earnings are below an SSA threshold. The National Research Council convened an expert committee at the request of the SSA to study the issues related to disability determination for people with hearing loss. This volume is the product of that study. *Hearing Loss: Determining Eligibility for Social Security Benefits* reviews current knowledge about hearing loss and its measurement and treatment and provides an evaluation of the strengths and weaknesses of the current processes and criteria. It recommends changes to strengthen the disability determination process and ensure its reliability and fairness. The book addresses criteria for selection of pure tone and speech tests; guidelines for test administration; testing of hearing in noise; special issues related to testing children and the difficulty of predicting work capacity from clinical hearing test results. It should be useful to audiologists, otolaryngologists, disability advocates, and others who are concerned with people who have hearing loss.

**Memorandum Report**, 1970. *Relevant Acoustic Phonetics of L2 English*. Etienne Koffi, 2021-04-19. Intelligibility is the ultimate goal of human communication. However, measuring it objectively remained elusive until the 1940s when physicist Harvey Fletcher pioneered a psychoacoustic methodology for doing so. Another physicist, von Békésy, demonstrated clinically that Fletcher's theory of Critical Bands was anchored in anatomical and auditory reality. Fletcher's and Békésy's approach to intelligibility has revolutionized contemporary understanding of the processes involved in encoding and decoding speech signals. Their insights are applied in this book to account for the intelligibility of the pronunciation of 67 non-native speakers from the following language backgrounds: 10 Arabic, 10 Japanese, 10 Korean, 10 Mandarin, 11 Serbian and Croatian (the Slavic Group), 6 Somali, and 10 Spanish speakers who read the Speech Accent Archive elicitation paragraph. Their pronunciation is analyzed instrumentally and compared and contrasted with that of 10 native speakers of General American English (GAE) who read the same paragraph. The data-driven intelligibility analyses proposed in this book help answer the following questions: Can L2 speakers of English whose native

language lacks a segment segments or a suprasegment suprasegments manage to produce it them intelligibly If they cannot what segments or suprasegments do they use to substitute for it them Do the compensatory strategies used interfere with intelligibility The findings reported in this book are based on nearly 12 000 measured speech tokens produced by all the participants This includes some 2 000 vowels more than 500 stop consonants over 3 000 fricatives nearly 1 200 nasals about 1 500 approximants a over 1 200 syllables onsets as many as 800 syllable codas more than 1 600 measurement of F0 pitch and duration measurements of no fewer than 539 disyllabic words These measurements are in keeping with Baken and Orlikoff 2000 3 and in accordance with widely accepted Just Noticeable Difference thresholds and relative functional load calculations provided by Catforda 1987
