**Subject Guide to Books in Print**, 1996      *Systems Science and Cybernetics - Volume I* Francisco Parra-Luna, 2009-10-30

The subject Systems sciences and cybernetics is the outcome of the convergence of a number of trends in a larger current of thought devoted to the growing complexity of primarily social objects and arising in response to the need for globalized treatment of such objects This has been magnified by the proliferation and publication of all manner of quantitative scientific data on such objects advances in the theories on their inter relations the enormous computational capacity provided by IT hardware and software and the critical revisiting of subject object interaction not to mention the urgent need to control the efficiency of complex systems where efficiency is understood to mean the ability to find a solution to many social problems including those posed on a planetary scale The result has been the forging of a new academically consolidated scientific trend going by the name of Systems Theory and Cybernetics with a comprehensive multi disciplinary focus and therefore apt for understanding realities still regarded to be inescapably chaotic This subject entry is subdivided into four sections The first an introduction to systemic theories addresses the historic development of the most commonly used systemic approaches from new concepts such as the so called geometry of thinking or the systemic treatment of non systemic identities to the taxonomic entropic axiological and ethical problems deriving from a general systemic cybernetic conceit Hence the focus in this section is on the historic and philosophical aspects of the subject Moreover it may be asserted today that beyond a shadow of a doubt problems in particular problems deriving from human interaction but in general any problem regardless of its nature must be posed from a systemic perspective for otherwise the obstacles to their solution are insurmountable Reaching such a perspective requires taking at least the following well known steps a statement of the problem from the determinant variables or phenomena b adoption of theoretical models showing the interrelationships among such variables c use of the maximum amount of wherever possible quantitative information available on each d placement of the set of variables in an environment that inevitably pre determines the problem That epistemology would explain the substantial development of the systemic cybernetic approach in recent decades The articles in the second section deal in particular with the different methodological approaches developed when confronting real problems from issues that affect humanity as a whole to minor but specific questions arising in human organizations Certain sub themes are discussed by the various authors always from a didactic vantage including problem discovery and diagnosis and development of the respective critical theory the design of ad hoc strategies and methodologies the implementation of both qualitative soft system methodologies and formal and quantitative such as the General System Problem Solver or the axiological operational perspective approaches cross disciplinary integration and suitable methods for broaching psychological cultural and socio political dynamisms The third section is devoted to cybernetics in the present dual meaning of the term on the one hand

control of the effectiveness of communication and actions and on the other the processes of self production of knowledge through reflection and the relationship between the observing subject and the observed object when the latter is also observer and the former observed Known as second order cybernetics this provides an avenue for rethinking the validity of knowledge such as for instance when viewed through what is known as bipolar feedback processes through which interactions create novelty complexity and diversity Finally the fourth section centres around artificial and computational intelligence addressing sub themes such as neural networks the simulated annealing that ranges from statistical thermodynamics to combinatory problem solving such as in the explanation of the role of adaptive systems or when discussing the relationship between biological and computational intelligence      **Lasers and Electro-optics** Christopher C. Davis, 1996-05-02 Comprehensive textbook covering the physics and engineering aspects of lasers and electro optic devices

**Terahertz Technology** Ali Rostami, Hassan Rasooli, Hamed Baghban, 2010-11-25 The book presents information about Terahertz science Terahertz photodetectors and Terahertz Lasers A special emphasis is given to room temperature operation of long wavelength photodetectors based on novel quantum dots Centered Defect Spherical Quantum Dots Moreover a complete analysis of systems based on Quantum Cascade structures to detect far infrared wavelengths is provided Finally the book presents Terahertz laser principles considering multi color lasers in this range of wavelengths Written as a background for graduate students in the Optics field      *Basic Optics* Avijit Lahiri, 2016-08-29 Basic Optics Principles and Concepts addresses in great detail the basic principles of the science of optics and their related concepts The book provides a lucid and coherent presentation of an extensive range of concepts from the field of optics which is of central relevance to several broad areas of science including physics chemistry and biology With its extensive range of discourse the book s content arms scientists and students with knowledge of the essential concepts of classical and modern optics It can be used as a reference book and also as a supplementary text by students at college and university levels and will at the same time be of considerable use to researchers and teachers The book is composed of nine chapters and includes a great deal of material not covered in many of the more well known textbooks on the subject The science of optics has undergone major changes in the last fifty years because of developments in the areas of the optics of metamaterials Fourier optics statistical optics quantum optics and nonlinear optics all of which find their place in this book with a clear presentation of their basic principles Even the more traditional areas of ray optics and wave optics are elaborated within the framework of electromagnetic theory at a level more fundamental than what one finds in many of the currently available textbooks Thus the eikonal approximation leading to ray optics the Lagrangian and Hamiltonian formulations of ray optics the quantum theoretic interpretation of interference the vector and dyadic diffraction theories the geometrical theory of diffraction and similar other topics of basic relevance are presented in clear terms The presentation is lucid and elegant capturing the essential magic and charm of physics All this taken together makes the book a unique text of major contemporary relevance
