3D Remote Sensing Applications in Forest Ecology Hooman Latifi, Ruben Valbuena, 2019-11-19 Dear Colleagues The composition structure and function of forest ecosystems are the key features characterizing their ecological properties and can thus be crucially shaped and changed by various biotic and abiotic factors on multiple spatial scales The magnitude and extent of these changes in recent decades calls for enhanced mitigation and adaption measures Remote sensing data and methods are the main complementary sources of up to date synoptic and objective information of forest ecology Due to the inherent 3D nature of forest ecosystems the analysis of 3D sources of remote sensing data is considered to be most appropriate for recreating the forest s compositional structural and functional dynamics In this Special Issue of *Forests* we published a set of state of the art scientific works including experimental studies

methodological developments and model validations all dealing with the general topic of 3D remote sensing assisted applications in forest ecology We showed applications in forest ecology from a broad collection of method and sensor combinations including fusion schemes All in all the studies and their focuses are as broad as a forest s ecology or the field of remote sensing and thus reflect the very diverse usages and directions toward which future research and practice will be directed

Ecology of Wildfire Residuals in Boreal Forests Ajith Perera,Lisa Buse,2014-07-21 Large and intense wildfires are integral to the globally important boreal forest biome While much is known about boreal wildfires the focus on forest remnants that either escape or survive these intense fires is a recent phenomenon academics now study ecological processes of wildfire residuals forest policymakers use their patterns to design harvest strategies forest managers consider their economic value and conservationists recognize their intrinsic ecological importance Ecology of Wildfire Residuals in Boreal Forests is the first book to explore ecological patterns and processes of what does not burn within boreal wildfires Following a brief introduction to the boreal forest biome it discusses the processes that form wildfire residuals how they are studied with various approaches and methods the types extent and ecological functions of wildfire residuals and their role in forest management applications all in the context of ecological scale This book is a reference for researchers and graduate students studying boreal forest ecology as well as for policymakers and forest managers It adopts a non reductionist perspective that will be of interest to scientists from conservation science forest ecology forest management and timber production Brings together fire behaviour ecological scale vegetation ecology and conservation biology to provide a cross disciplinary multi scale and an integrative discussion of forest fire residuals Captures the state of knowledge with a meta analysis of research trends during the past few decades with a comprehensive review of the literature a compilation of key references and a list of key topics relevant to the study of boreal wildfire residuals Identifies the major gaps and uncertainties in the present body of knowledge including a critique of study techniques and reporting practices to date and proposes a set of terms and definitions and a list of research questions and priorities Includes the authors observations and research experience from boreal Canada and information extracted from interactions with North American and European ecologists forest managers and conservationists

Advances in Forest Inventory for Sustainable Forest Management and Biodiversity Monitoring Piermaria Corona,Michael Köhl,Marco Marchetti,2013-04-17 Forests represent a remnant wilderness of high recreational value in the densely populated industrial societies a threatened natural resource in some regions of the world and a renewable reservoir of essential raw materials for the wood processing industry In June 1992 the United Nations Conference on the Environment and Development UNCED in Rio de Janeiro initiated a world wide process of negotiation with the aim of ensuring sustainable management conservation and development of forest resources Although there seems to be unanimous support for sustainable development from all quarters there is no generally accepted set of indicators which allows comparisons to be made between a given situation and a desirable one In a recent summary paper prepared by the FAO

Forestry and Planning Division Ljungman et al 1999 find that forest resources continue to diminish while being called upon to produce a greater range of goods and services and that calls for sustainable forest management will simply go unheeded if the legal policy and administrative environment do not effectively control undesirable practices Does the concept of sustainable forest management represent not much more than a magic formula for achieving consensus a vague idea which makes it difficult to match action to rhetoric The concept of sustainable forest management is likely to remain an imprecise one but we can contribute to avoiding management practices that are clearly unsustainable *Forest and Stream* ,1890
