Introduction To Stochastic Processes Mu-fa Chen, Yong-hua Mao, 2021-05-25 The objective of this book is to introduce the elements of stochastic processes in a rather concise manner where we present the two most important parts Markov chains and stochastic analysis The readers are led directly to the core of the main topics to be treated in the context Further details and additional materials are left to a section containing abundant exercises for further reading and studying In the part on Markov chains the focus is on the ergodicity By using the minimal nonnegative solution method we deal with the recurrence and various types of ergodicity This is done step by step from finite state spaces to denumerable state spaces and from discrete time to

continuous time The methods of proofs adopt modern techniques such as coupling and duality methods Some very new results are included such as the estimate of the spectral gap The structure and proofs in the first part are rather different from other existing textbooks on Markov chains In the part on stochastic analysis we cover the martingale theory and Brownian motions the stochastic integral and stochastic differential equations with emphasis on one dimension and the multidimensional stochastic integral and stochastic equation based on semimartingales We introduce three important topics here the Feynman Kac formula random time transform and Girsanov transform As an essential application of the probability theory in classical mathematics we also deal with the famous Brunn Minkowski inequality in convex geometry This book also features modern probability theory that is used in different fields such as MCMC or even deterministic areas convex geometry and number theory It provides a new and direct routine for students going through the classical Markov chains to the modern stochastic analysis

A Modern Approach to Probability Theory Bert E. Fristedt, Lawrence F. Gray, 2013-11-21 Overview This book is intended as a textbook in probability for graduate students in mathematics and related areas such as statistics economics physics and operations research Probability theory is a difficult but productive marriage of mathematical abstraction and everyday intuition and we have attempted to exhibit this fact Thus we may appear at times to be obsessively careful in our presentation of the material but our experience has shown that many students find themselves quite handicapped because they have never properly come to grips with the subtleties of the definitions and mathematical structures that form the foundation of the field Also students may find many of the examples and problems to be computationally challenging but it is our belief that one of the fascinating aspects of probability theory is its ability to say something concrete about the world around us and we have done our best to coax the student into doing explicit calculations often in the context of apparently elementary models The practical applications of probability theory to various scientific fields are far reaching and a specialized treatment would be required to do justice to the interrelations between probability and any one of these areas However to give the reader a taste of the possibilities we

have included some examples particularly from the field of statistics such as order statistics Dirichlet distributions and minimum variance unbiased estimation

Hybrid Switching Diffusions G. George Yin, Chao Zhu, 2009-10-03 This book encompasses the study of hybrid switching diffusion processes and their applications The word hybrid signifies the coexistence of continuous dynamics and discrete events which is one of the distinct features of the processes under consideration Much of the book is concerned with the interactions of the continuous dynamics and the discrete events Our motivations for studying such processes originate from emerging and existing applications in wireless communications signal processing queueing networks production planning biological systems ecosystems financial engineering and modeling analysis and control and optimization of large scale systems under the influence of random environments Displaying mixture distributions switching diffusions may be described by the associated operators or by systems of stochastic differential equations together with the probability transition laws of the switching actions We either have Markov modulated switching diffusions or processes with continuous state dependent switching The latter turns out to be much more challenging to deal with Viewing the hybrid diffusions as a number of diffusions joined together by the switching process they may be surprisingly not much different from their diffusion counterpart Nevertheless the underlying problems become more difficult to handle especially when the switching processes depend on continuous states The difficulty is due to the interaction of the discrete and continuous processes and the tangled and hybrid information pattern

Functional Inequalities Markov Semigroups and Spectral Theory Fengyu Wang, 2006-04-06 In this book the functional inequalities are introduced to describe i the spectrum of the generator the essential and discrete spectrums high order eigenvalues the principle eigenvalue and the spectral gap ii the semigroup properties the uniform integrability the compactness the convergence rate and the existence of density iii the reference measure and the intrinsic metric the concentration the isoperimetric inequality and the transportation cost inequality

Analysis and Geometry of Metric Measure Spaces Galia Devora Dafni, Robert John McCann, Alina Stancu, 2013 This book contains lecture notes from most of the courses presented at the 50th anniversary edition of the Seminaire de Mathematiques Superieure in Montreal This 2011 summer school was devoted to the analysis and geometry of metric measure spaces and featured much interplay between this subject and the emergent topic of optimal transportation In recent decades metric measure spaces have emerged as a fruitful source of mathematical questions in their own right and as indispensable tools for addressing classical problems in geometry topology dynamical systems and partial differential equations The summer school was designed to lead young scientists to the research frontier concerning the analysis and geometry of metric measure spaces by exposing them to a series of minicourses featuring leading researchers who highlighted both the state of the art and some of the exciting challenges which remain This volume attempts to capture the excitement of the summer school itself presenting the reader with glimpses into this active area of research and its connections with other branches of contemporary mathematics
