Microbial Pathogens Michael R Hamblin, Giulio Jori, 2015-11-09 Photodynamic therapy PDT was discovered over one hundred years ago after observing the death of microorganisms upon exposure to dyes and light It is the combination of non toxic dyes and harmless visible light that in the presence of oxygen produce highly toxic reactive species The principal medical application during the last century was in cancer therapy but in these days of rising antibiotic resistance PDT shows increasing promise as an alternative approach to treating infections PDT has also been used in blood product sterilization peridontology acne reduction and the treatment of viral lesions such as those caused by human papilloma virus It may also have potential as an environmentally friendly pesticide This is the first and only book to comprehensively cover the use of light and photosensitising agents for controlling microbial pathogens It provides a comprehensive and up to date coverage of an emerging field There are several chapters on the design of antimicrobial photosensitizers their use to kill pathogenic organisms and their success in treating infections in animal models It has long been known that gram positive bacteria are highly susceptible to photoinactivation but the book also discusses means of widening the range of microorganisms that can be tackled by PDT Edited by two pioneers in the application of PDT to medical and environmental issues this book covers the basic science translational research in animals and the clinical applications in various medical specialities It represents an indispensable resource for microbiologists and infectious disease doctors as well as dentists dermatologists gastroenterologists and transfusion specialists

Light in Forensic Science Mire Zloh, Jacqueline L Stair, Giorgia Miolo, 2018-04-18 The identification and quantification of material present and collected at a crime scene are critical requirements in investigative analyses Forensic analysts use a variety of tools and techniques to achieve this many of which use light Light is not always the forensic analyst s friend however as light can degrade samples and alter results This book details the analysis of a range of molecular systems by light based techniques relevant to forensic science as well as the negative effects of light in the degradation of forensic evidence such as the breakage of DNA linkages during DNA profiling The introductory chapters explain how chemiluminescence and fluorescence can be used to visualise samples and the advantages and limitations of available technologies They also discuss the limitations of our knowledge about how light could alter the physical nature of materials for example by breaking DNA linkages during DNA profiling or by modifying molecular structures of polymers and illicit drugs The book then explains how to detect analyse and interpret evidence from materials such as illicit drugs agents of bioterrorism and textiles using light based techniques from microscopy to surface enhanced Raman spectroscopy Edited by active photobiological and forensic scientists this book will be of interest to students and researchers in the fields of photochemistry photobiology toxicology and forensic science

DNA Photodamage Roberto Improta,Thierry Douki,2021-12-06 Induction of DNA damage by sunlight is a major deleterious event in living organisms Recent developments have dramatically improved our understanding of the photochemical processes involved at the sub picosecond time scale and along with next generation sequencing and data processing has generated a need for a complete up to date coverage of the field Written in an accessible and comprehensive manner DNA Photodamage will appeal to all scientists working in the area whether specialists in the discipline or not and provides a complete coverage of the field from ultrafast spectroscopy to biomedical research Bridging the gap between photophysical and photochemical research on model systems and in vivo and in vitro biological studies this book aims to identify the most important research trends in the field and review their major findings

Radiation-induced and oxidative DNA damages Antonio Monari,Elise Dumont,Chrysostomos Chatgililoglu,2015-10-02 DNA stores and passes the genetic information of almost all living organisms Its molecular structure and their intramolecular interactions are particularly suitable to maximize stability against oxidative stress and UV light absorption Yet the protection and repair strategies are still error prone DNA lesions are produced including the most complex and highly mutagenic ones An important threat to DNA stability comes from photosensitization i e from the dramatic multiplication of radiation induced defects mediated by the presence of organic or organometallic dyes compared to the direct exposure to UVA radiation Moreover the photo induced production of singlet oxygen generates an extremely high oxidative stress on DNA that in vivo normally results in extended cellular apoptosis Elucidating the processes leading to DNA damages from the production of a simple radical entity to deleterious lesions as well as the opportunities of repair by devoted enzymes is a cornerstone towards the development of more efficient protection strategies Sensitization and selective production of DNA lesions can also be exploited to induce the selective apoptosis of cancer cells upon exposition to radiation or to oxidative stress for instance in the field of photodynamic therapy The importance and relevance of the field is witnessed by the impressive amount of high level papers dealing with this complex subject and notably tackling the structural elucidation of DNA and DNA drug adducts the mechanisms of formation of DNA lesions including the precise detection of the final lesion products as well as the influence of the lesions on the DNA stability and dynamics and the consequences on the ease of repair Due to the complexity of the field lying at the frontiers between chemistry physics and biology multidisciplinary strategies allying modeling and experience are needed This topic aims at giving an extended overview of the current research in the domain with fundamental contribution from the leading groups in the field of DNA reactivity structural characterization photo chemistry and photo physics as well as repair mechanism It will therefore be a fundamental guide for scientists wanting to address the field of DNA lesion and repair but also more generally for researchers working in rational drug design or in the development of biomarkers and medical imaging techniques
