Extremal Combinatorial Problems And Their Applications:

Extremal Combinatorial Problems and Their Applications B.S. Stechkin,V.I. Baranov,2007-08-19 Combinatorial research has proceeded vigorously in Russia over the last few decades based on both translated Western sources and original Russian material The present volume extends the extremal approach to the solution of a large class of problems including some that were hitherto regarded as exclusively algorithmic and broadens the choice of theoretical bases for modelling real phenomena in order to solve practical problems Audience Graduate students of mathematics and engineering interested in the thematics of extremal problems and in the field of combinatorics in general Can be used both as a textbook and as a reference handbook

The Theory of Partial Algebraic Operations E.S. Ljapin,A.E. Evseev,2013-04-17 Nowadays algebra is understood basically as the general theory of algebraic operations and relations It is characterised by a considerable intrinsic naturalness of its initial notions and problems the unity of its methods and a breadth that far exceeds that of its basic concepts It is more often that its power begins to be displayed when one moves outside its own limits This characteristic ability is seen when one investigates not only complete operations but partial operations To a considerable extent these are related to algebraic operators and algebraic operations The tendency to ever greater generality is amongst the reasons that play a role in explaining this development But other important reasons play an even greater role Within this same theory of total operations that is operations defined everywhere there persistently arises in its different sections a necessity of examining the emergent feature of various partial operations It is particularly important that this has been found in those parts of algebra it brings together and other areas of mathematics it interacts with as well as where algebra finds application at the very limits of mathematics In this connection we mention the theory of the composition of mappings category theory the theory of formal languages and the related theory of mathematical linguistics coding theory information theory and algebraic automata theory In all these areas as well as in others from time to time there arises the need to consider one or another partial operation

A Guide to the Literature on Semirings and their Applications in Mathematics and Information Sciences K. Glazek, 2002-06-30 This book presents a guide to the extensive literature on the topic of semirings and includes a complete bibliography It serves as a complement to the existing monographs and a point of reference to researchers and students on this topic The literature on semirings has evolved over many years in a variety of languages by authors representing different schools of mathematics and working in various related fields Recently semiring theory has experienced rapid development although publications are widely scattered This survey also covers those newly emerged areas of semiring applications that have not received sufficient treatment in widely accessible monographs as well as many lesser known or forgotten works The author has been collecting the bibliographic data for this book since 1985 Over the years it has proved very useful for specialists For example J S Golan wrote he owed a special debt to Kazimierz Glazek whose bibliography proved to be an invaluable guide to the bewildering maze of literature on semirings U Hebisch and H J Weinert also mentioned his collection of literature had been of great assistance to them Now updated to include publications up to

the beginning of 2002 this work is available to a wide readership Audience This volume is the first single reference that can guide the interested scholar or student to the relevant publications in semirings semifields algebraic theory of languages and automata positive matrices and other generalisations and ordered semigroups and groups **The Mathematics of Paul Erdős II** Ronald L. Graham, Jaroslav Nešetřil, 2012-12-06 In 1992 when Paul Erdős was awarded a Doctor Honoris Causa by Charles University in Prague a small conference was held bringing together a distinguished group of researchers with interests spanning a variety of fields related to Erdős own work At that gathering the idea occurred to several of us that it might be quite appropriate at this point in Erdős career to solicit a collection of articles illustrating various aspects of Erdős mathematical life and work The response to our solicitation was immediate and overwhelming and these volumes are the result Regarding the organization we found it convenient to arrange the papers into six chapters each mirroring Erdős holistic approach to mathematics Our goal was not merely a random collection of papers but rather a thoroughly edited volume composed in large part by articles explicitly solicited to illustrate interesting aspects of Erdős and his life and work Each chapter includes an introduction which often presents a sample of related Erdős problems in his own words All these sometimes lengthy introductions were written jointly by editors We wish to thank the nearly 70 contributors for their outstanding efforts and their patience In particular we are grateful to Bela Bollobás for his extensive documentation of Paul Erdős early years and mathematical high points in the first part of this volume our other authors are acknowledged in their respective chapters We also want to thank A Bondy G Hahn I *Non-Archimedean Analysis: Quantum Paradoxes, Dynamical Systems and Biological Models* Andrei Y. Khrennikov, 2013-03-07 Natur non facit saltus This book is devoted to the fundamental problem which arises continuously in the process of the human investigation of reality the role of a mathematical apparatus in a description of reality We pay our main attention to the role of number systems which are used or may be used in this process We shall show that the picture of reality based on the standard since the works of Galileo and Newton methods of real analysis is not the unique possible way of presenting reality in a human brain There exist other pictures of reality where other number fields are used as basic elements of a mathematical description In this book we try to build a p-adic picture of reality based on the fields of p-adic numbers \mathbb{Q}_p and corresponding analysis a particular case of so called non-Archimedean analysis However this book must not be considered as only a book on p-adic analysis and its applications We study a much more extended range of problems Our philosophical and physical ideas can be realized in other mathematical frameworks which are not obliged to be based on p-adic analysis We shall show that many problems of the description of reality with the aid of real numbers are induced by unlimited applications of the so called Archimedean axiom Solving Combinatorial Problems with SAT Yuriy Chebiryak, 2013-01-16 A dissertation submitted to ETH Zurich for the degree of Doctor of Sciences presented by Yuriy Chebiryak 2012 *Integer Programming and Combinatorial Optimization* George Nemhauser, Daniel Bienstock, 2004-07-27 This volume contains the papers accepted for publication at IPCO X the

Tenth International Conference on Integer Programming and Combinatorial Optimization held in New York City New York USA June 7-11 2004 The IPCO series of conferences presents recent results in theory computation and applications of integer programming and combinatorial optimization These conferences are sponsored by the Mathematical Programming Society and are held in those years in which no International Symposium on Mathematical Programming takes place IPCO VIII was held in Utrecht The Netherlands and IPCO IX was held in Cambridge USA A total of 109 abstracts mostly of very high quality were submitted The Program Committee accepted 32 in order to meet the goal of having three days of talks with no parallel sessions Thus many excellent abstracts could not be accepted The papers in this volume have not been refereed It is expected that revised versions of the accepted papers will be submitted to standard scientific journals for publication The Program Committee thanks all authors of submitted manuscripts for their support of IPCO March 2004 George Nemhauser Daniel Bienstock Organization IPCO X was hosted by the Computational Optimization Research Center CORC Columbia University

On Combinatorial Problems of Extremal Nature and Games Humberto Silva Naves, 2014 Extremal graph theory is a branch of discrete mathematics and also the central theme of extremal combinatorics It studies graphs which are extremal with respect to some parameter under certain restrictions A typical result in extremal graph theory is Mantel's theorem It states that the complete bipartite graph with equitable parts is the graph that maximizes the number of edges among all triangle free graphs One can say that extremal graph theory studies how local properties of a graph influence its global structure Another fundamental topic in the field of combinatorics is the probabilistic method which is a nonconstructive method pioneered by Paul Erdős for proving the existence of a prescribed kind of mathematical object One particular application of the probabilistic method lies in the field of positional games more specifically Maker-Breaker games My dissertation focus mainly on various Turán type questions and their applications to other related areas as well as the

employment of the probabilistic method to study extremal problems and positional games

Computational and Constructive Design Theory W.D. Wallis, 2013-06-29 Over the last several years there has been a significant increase in computational combinatorics. The most widely reported results were of course the proof of the Four Color Theorem and the proof that there is no projective plane of parameter 10. Although the computer was essential in both proofs the only reason for this was the fact that life is short. The computations involved were not different in kind from those which have been done by human brains without electronic assistance; they were just longer. Another important fact to notice is that both problems were theoretical pure mathematical ones. The pursuit of the Four Color Theorem has led to the development of whole branches of graph theory. The plane of parameter 10 is not an isolated case; its nonexistence is the first and so far the only counterexample to the conjecture that the Bruck-Chowla-Ryser conditions were necessary and sufficient for the existence of a symmetric balanced incomplete block design. The study of this problem has also led to a number of theoretical advances including investigation of the relationship between codes and designs.

Topics in Number Theory Scott D. Ahlgren, George E. Andrews, Ken Ono, 2013-12-01 From July 31 through August 3, 1997, the Pennsylvania State University hosted the Topics in Number Theory Conference. The conference was organized by Ken Ono and myself. By writing the preface, I am afforded the opportunity to express my gratitude to Ken for being the inspiring and driving force behind the whole conference. Without his energy, enthusiasm, and skill, the entire event would never have occurred. We are extremely grateful to the sponsors of the conference: The National Science Foundation, The Penn State Conference Center, and the Penn State Department of

Algebraic Integrability of Nonlinear Dynamical Systems on Manifolds A.K. Prykarpatsky, I.V. Mykytiuk, 2013-04-09 In recent times it has been stated that many dynamical systems of classical mathematical physics and mechanics are endowed with symplectic structures given in the majority of cases by Poisson brackets Very often such Poisson structures on corresponding manifolds are canonical which gives rise to the possibility of producing their hidden group theoretical essence for many completely integrable dynamical systems It is a well understood fact that great part of comprehensive integrability theories of nonlinear dynamical systems on manifolds is based on Lie algebraic ideas by means of which in particular the classification of such compatibly bi Hamiltonian and isospectrally Lax type integrable systems has been carried out Many chapters of this book are devoted to their description but to our regret so far the work has not been completed Hereby our main goal in each analysed case consists in separating the basic algebraic essence responsible for the complete integrability and which is at the same time in some sense universal i.e characteristic for all of them Integrability analysis in the framework of a gradient holonomic algorithm devised in this book is fulfilled through three stages 1 finding a symplectic structure Poisson bracket transforming an original dynamical system into a Hamiltonian form 2 finding first integrals action variables or conservation laws 3 defining an additional set of variables and some functional operator quantities with completely controlled evolutions for instance as Lax type representation

Meromorphic Functions and Projective Curves Kichoon Yang, 2013-11-27 This book contains an exposition of the

theory of meromorphic functions and linear series on a compact Riemann surface. Thus the main subject matter consists of holomorphic maps from a compact Riemann surface to complex projective space. Our emphasis is on families of meromorphic functions and holomorphic curves. Our approach is more geometric than algebraic along the lines of Griffiths and Harris. Also we have relied on the books of Namba and Arbarello-Cornalba, Griffiths and Harris to a great extent. Nearly every result in Chapters 1 through 4 can be found in the union of these two books. Our primary motivation was to understand the totality of meromorphic functions on an algebraic curve. Though this is a classical subject and much is known about meromorphic functions, we felt that an accessible exposition was lacking in the current literature. Thus our book can be thought of as a modest effort to expose parts of the known theory of meromorphic functions and holomorphic curves with a geometric bent. We have tried to make the book self-contained and concise, which meant that several major proofs not essential to further development of the theory had to be omitted. The book is targeted at the non-expert who wishes to learn enough about meromorphic functions and holomorphic curves so that he/she will be able to apply the results in his/her own research. For example, a differential geometer working in minimal surface theory may want to find out more about the distribution pattern of poles and zeros of a meromorphic function.
