

What Is a Charpy Impact Test?

The Charpy impact test, also known as the Charpy V-notch test, measures the energy absorbed by a material when fractured under impact. A pendulum strikes a notched specimen (55 mm long, 10 mm square, with a 2 mm deep V-notch), and the energy is recorded in joules.

This test determines if the material is brittle or ductile, commonly used for metals, polymers, and ceramics, providing a total energy value without detailing fracture phases like initiation or propagation.
