From Data Structures to Patterns Darrel Ince,2000-06-22 From Data Structures to Patterns provides a comprehensive introduction for undergraduate students taking a course on data structures and abstract data types It also addresses the problem of how to design large abstract data types which contain many small data types a missing dimension in many text books While the first half concentrates on a conventional treatment of data structures and data types the second half introduces two separate strands how aggregation and inheritance can be used to build upon the base data provided by a class library and describes design patterns common collections of objects which encourage reuse Rather than focusing on the needs of students who will continue on to research From Data Structures to Patterns is a valuable introduction to those students who intend to work in industry This text book is part of the Grassroots series which provides core concise texts at affordable prices across a range of computing courses

Algorithms and Data Structures Frank Dehne,1993-07-28 The papers in this volume were presented at the Third Workshop on Algorithms and Data Structures WADS 93 held in Montreal Canada August 1993 The volume opens with five invited presentations Computing the all pairs longest chains in the plane by M J Atallah and D Z Chen Towards a better understanding of pure packet routing by A Borodin Tolerating faults in meshes and other networks abstract by R Cole A generalization of binary search by R M Karp and Groups and algebraic complexity abstract by A C Yao The volume continues with 52 regular presentations selected from 165 submissions each of which was evaluated by at least

three program committee members many of whom called upon additional reviewers *Data Structures for Raster Graphics* Laurens R.A. Kessener, Frans J. Peters, Marloes L.P. van Lierop, 2012-12-06 Raster graphics differs from the more traditional vector or line graphics in the sense that images are not made up from line segments but from discrete elements orderly arranged in a two dimensional rectangular region There are two reasons for the growing popularity of raster graphics or bit mapped displays 1 the possibilities they offer to show extremely realistic pictures 2 the dropping prices of those displays and associated processors and memories With the rise of raster graphics all kinds of new techniques methods algorithms and data representations are associated such as ray tracing raster operations and quadrees bringing with them a lot of fruitful research As stated above raster graphics allows to create extremely realistic synthesized pictures There are important applications in such diverse areas as industrial design flight Simulation education image processing and animation Unfortunately many applications are hampered by the fact that with the present state of the art they require an excessive amount of computing resources Hence it is worthwhile to investigate methods and techniques which may be of help in reducing computer costs associated with raster graphics applications Since the choice of data structures influences the efficiency of algorithms in a crucial way a workshop was set up in order to bring together a limited number of experienced researchers to discuss this topic The workshop was held from 24 to 28 June 1985 at Steensel a tiny village in the neighbourhood of Eindhoven the Netherlands Data Structures & Algorithm Analysis in C++ Clifford A.
