The Design of Aircraft Landing Gear Robert Kyle Schmidt, 2021-02-18 The aircraft landing gear and its associated systems represent a compelling design challenge simultaneously a system a structure and a machine it supports the aircraft on the ground absorbs landing and braking energy permits maneuvering and retracts to minimize aircraft drag Yet as it is not required during flight it also represents dead weight and significant effort must be made to minimize its total mass The Design of Aircraft Landing Gear written by R Kyle Schmidt PE B A Sc Mechanical Engineering M Sc Safety and Aircraft Accident Investigation Chairman of the SAE A 5 Committee on Aircraft Landing Gear is designed to guide the reader through the key principles of landing system design and to provide additional references when available Many problems which must be confronted have already been addressed by others in the past but the information is not known or shared leading to the observation that there are few new problems but many new people The Design of Aircraft Landing Gear is intended to share much of the existing information and provide avenues for further exploration The design of an aircraft and its associated systems including the landing system involves iterative loops as the impact of each modification to a system or component is evaluated against the whole It is rare to find that the lightest possible landing gear represents the best solution for the aircraft the lightest landing gear may require attachment structures which don't exist and which would require significant weight and compromise on the part of the airframe structure design With those requirements and compromises in mind The Design of Aircraft Landing Gear starts with the study of airfield compatibility aircraft stability on the ground the correct choice of tires followed by discussion of brakes wheels and brake control systems Various landing gear architectures are investigated together with the details of shock absorber designs Retraction kinematics and mechanisms are studied as well as possible actuation approaches Detailed information on the various hydraulic and electric services commonly found on aircraft and system elements such as dressings lighting and steering are also reviewed Detail design points the process of analysis and a review of the relevant requirements and regulations round out the book content The Design of Aircraft Landing Gear is a landmark work in the industry and a must read for any engineer interested in updating specific skills and students preparing for an exciting career

German and Italian Aircraft Carriers of World War II Ryan K. Noppen, Douglas C. Dildy, 2022-05-26 This fully illustrated study details Germany and Italy's failed development of World War II aircraft carriers and the naval aviation ships that the two Axis powers sent into action in their place The quest for a modern aircraft carrier was the ultimate symbol of the Axis powers challenge to Allied naval might but fully fledged carriers proved either too difficult expensive or politically unpopular for either to make operational After the Anglo German Naval Agreement of 1935 Hitler publicly stated his intention to build an aircraft carrier the Graf Zeppelin which was launched in 1938 A year

later the ambitious fleet expansion Z Plan was unveiled with two additional aircraft carriers earmarked for production. However by the beginning of World War II Graf Zeppelin was not yet completed and work was halted. Further aircraft carrier designs and conversion projects such as the ocean liner Europa and heavy cruiser Seydlitz were considered but in January 1943 all construction work on surface vessels ceased and naval resources were diverted to the U boat Campaign. This book explains not only the history of Germany's famous Graf Zeppelin fleet carrier and German carrier conversion projects but also Italy's belated attempt to convert two of her ocean liners into carriers. It considers the role of naval aviation in the two countries' rearmament programmes and describes how ultimately it was only Italian seaplane carriers and German ocean going catapult equipped flying boat carriers that both Axis powers did eventually send into combat.

The Luftwaffe Kelly Mass, The Luftwaffe emerged from the ashes of Germany's World War I defeat as perhaps the most technologically advanced and tactically sophisticated air force of its era representing both the culmination of interwar military aviation development and the embodiment of Nazi Germany's aggressive ambitions. Born in secret during the 1920s and officially unveiled in 1935 the German air force would grow from a clandestine organization of fewer than 100 aircraft to a formidable military machine comprising over 4 000 combat aircraft at the outbreak of World War II. This transformation reflected not only German industrial capability and military innovation but also the strategic vision of leaders who understood that air power would be decisive in future conflicts. The Treaty of Versailles had explicitly forbidden Germany from possessing military aircraft but German aviation enthusiasts and military planners found creative ways to circumvent these restrictions while laying the foundation for future air power development. Commercial aviation companies like Junkers and Heinkel continued aircraft development under civilian auspices while German pilots gained experience flying in the Soviet Union through secret cooperation agreements that benefited both nations. The German gliding movement which flourished during the 1920s provided basic aviation training to thousands of young Germans who would later form the nucleus of the Luftwaffe's pilot corps. Hermann Göring's appointment as Reich Minister of Aviation in 1933 marked the beginning of the Luftwaffe's rapid expansion and institutionalization as a major component of German military power. Göring a World War I fighter ace and early Nazi Party member possessed both the aviation experience and political connections necessary to build a modern air force while navigating the complex bureaucratic landscape of Nazi Germany. His leadership while sometimes erratic and increasingly divorced from operational realities provided the political support and resources needed to transform German aviation from a collection of secret programs into a unified military service.

Innovation and the Development of Flight Roger D. Launius, 1999 Perhaps no technological development in the century has more fundamentally transformed human life than the airplane and its support apparatus. The nature of flight and the activities that it has engendered

throughout the world makes the development of aviation technology an important area of investigation Why did aeronautical technology take the shape it did Which individuals and organizations were involved in driving it What factors influenced particular choices of technologies to be used More importantly how has innovation affected this technology Innovation and the Development of Flight a first strike at the new aviation history represents a significant transformation of the field by relating the subject to larger issues of society politics and culture taking a more sophisticated view of the technology that few historians have previously attempted This volume moves beyond a focus on the artifact to emphasize the broader role of the airplane and more importantly the entire technological system This suggests that many unanswered questions are present in the development of modern aviation and that inquisitive historians seek to know the relationships of technological systems to the human mind Some of the subjects discussed are early aeronautical innovation and government patronage the evolution of relationships among airports cities and industry the relationship of engine development to the entire aviation industry the Department of Commerce s influence on light plane development pressure in the Air Force for the development of jet engines and lessons of the National Aerospace Plane Program Aviation historians and historians of technology will find Innovation and the Development of Flight a valuable examination of aeronautical innovation providing foundations for continued explorations of this field
