Farm Animal Genetic Resources Bsas Publication 3:

Utilisation and conservation of farm animal genetic resources Kor Oldenbroek, 2023-08-28 The genetic diversity comprised in farm animal species and breeds is an important resource in livestock systems For several reasons within the different species used for food production only a few breeds are developed towards high output breeds fitting in high input systems In this process many breeds are set aside from the food producing livestock systems These breeds will be faced with extinction unless new functions for these breeds are found This is a real threat for the genetic diversity within species This book is intended to give insight into the issues of the utilisation and conservation of farm animal genetic resources towards a broad group of readers interested in these subjects The insight is presented as applications of population molecular and quantitative genetics that can be used to take appropriate decisions in utilisation and conservation programmes A previous edition of this book is a key resource in courses worldwide and cited in many scientific publications The first two chapters discuss the decisions to be made in utilisation and conservation Chapter 3 surveys the different ways in which the diversity we observe within a species can be characterised Chapter 4 illustrates recent results using this theory for utilisation and conservation purposes Chapters 5 6 and 7 give theoretical backgrounds necessary to make decisions and chapters 8 and 9 present the operation and practical implications of selection and conservation schemes **Animal Genetic Resources**

Animal Breeding, Welfare and Society Jacky Turner, 2010-08-12 The determination of when how how often and with whom an animal breeds is moving rapidly away from evolutionary pressures and towards human purposes these include the breeding of around 50 billion mammals and birds for food production annually the breeding of pedigree dogs and cats racing dogs and horses specialised laboratory animal strains and the use of reproductive science to conserve endangered species or breeds and to limit unwanted populations of pests and non native species But the ethics and sustainability of this takeover of animals reproductive lives have been insufficiently examined by either professionals or the public This book discusses the methods the motivations and the consequences of human

intervention in animal breeding in terms of animal health behaviour and well being It explores where we are now and the choices ahead and looks to a future where we have more respect for animals as sentient beings and where we could loosen the reins of reproductive control

Livestock Biodiversity Stephen J. G. Hall, 2008-04-15 Livestock biodiversity is integral to our culture history environment economy and most importantly our future Thousands of livestock breeds from relatively small genetic pools have evolved over time to suit particular environments and farming systems This is both the result of natural processes and of human needs for specialized livestock as our knowledge of genetics continues to increase we achieve a greater understanding of how this biodiversity evolved This book offers a detailed and comprehensive overview of livestock biodiversity It explores the history behind it shows how livestock biodiversity can be utilized as animal genetic resources through breed development and by crossbreeding examines the state of world livestock biodiversity today and emphasizes the importance of conserving and developing the biodiversity of livestock Special consideration is given to How livestock biodiversity arose and is maintained in relation to human society How it can be used in sustainable agricultural development How it can be conserved for the benefit of present and future generations Why conservation biologists as well as agriculturists should be involved in its protection

Trees, Forested Landscapes and Grazing Animals Ian D. Rotherham, 2013 In this comprehensive book the critical components of the European landscape forest parkland and other grazed landscapes with trees are addressed The book considers the history of grazed treed landscapes of large grazing herbivores in Europe and the implications of the past in shaping our environment today and in the future Debates on the types of anciently grazed landscapes in Europe and what they tell us about past and present ecology have been especially topical and controversial recently This treatment brings the current discussions and the latest research to a much wider audience The book breaks new ground in broadening the scope of wood pasture and woodland research to address sites and ecologies that have previously been overlooked but which hold potential keys to understanding landscape dynamics Eminent contributors including Oliver Rackham and Frans Vera present a text which addresses the importance of history in understanding the past landscape and the relevance of historical ecology and landscape studies in providing a future vision

Resource Allocation Theory Applied to Farm Animal Production Wendy M. Rauw, 2009 This book is about resource allocation matters with the aim to further development thoughts and models on resource allocation applied to livestock production It contains 18 chapters divided into 4 parts which discuss resources and resource allocation patterns trade offs metabolic constraints to resource allocation and the process of homeorhesis with a special emphasis to homeorhesis during heat stress the relationship between food intake and resources allocated to body maintenance growth reproduction and the immune response the consequences of high production efficiency in pigs poultry and dairy cattle and the consequences of improved production by means of biological engineering and options to include resource allocation matters in the breeding objective animal welfare and in resource allocation modelling

Yields of Farmed Species R. Sylvester-Bradley, Julian

Wiseman,2005 Presenting various solutions to issues facing the yields of farm species this perceptive study debates such topics as to what extent pests pathogens competing demands for resources or scruples about farming processes will curtail our ability to innovate in food production **The Atlantic Salmon** Eric Verspoor, Lee Stradmeyer, Jennifer L.

Nielsen,2008-04-15 Atlantic Salmon is a cultural icon throughout its North Atlantic range it is the focus of probably the World's highest profile recreational fishery and is the basis for one of the World's largest aquaculture industries Despite this many wild stocks of salmon are in decline and underpinning this is a dearth of information on the nature and extent of population structuring and adaptive population differentiation and its implications for species conservation This important new book will go a long way to rectify this situation by providing a thorough review of the genetics of Atlantic salmon Sponsored by the European Union and the Atlantic Salmon Trust this book comprises the work of an international team of scientists carefully integrated and edited to provide a landmark book of vital interest to all those working with Atlantic salmon *Advances in*

Farm Animal Genomic Resources Stéphane Joost, Michael W. Bruford, Ino Curik, Juha Kantanen, Johannes A. Lenstra, Johann Sölkner, Göran Andersson, Philippe V. Baret, Nadine Buys, Jutta Roosen, Michèle Tixier-Boichard, Paolo Ajmone

Marsan,2016-01-28 The history of livestock started with the domestication of their wild ancestors a restricted number of species allowed to be tamed and entered a symbiotic relationship with humans In exchange for food shelter and protection they provided us with meat eggs hides wool and draught power thus contributing considerably to our economic and cultural development Depending on the species domestication took place in different areas and periods After domestication livestock spread over all inhabited regions of the earth accompanying human migrations and becoming also trade objects This required an adaptation to different climates and varying styles of husbandry and resulted in an enormous phenotypic diversity Approximately 200 years ago the situation started to change with the rise of the concept of breed Animals were selected for the same visible characteristics and crossing with different phenotypes was reduced This resulted in the formation of different breeds mostly genetically isolated from other populations A few decades ago selection pressure was increased again with intensive production focusing on a limited range of types and a subsequent loss of genetic diversity For short term economic reasons farmers have abandoned traditional breeds As a consequence during the 20th century at least 28% of farm animal breeds became extinct rare or endangered The situation is alarming in developing countries where native breeds adapted to local environments and diseases are being replaced by industrial breeds In the most marginal areas farm animals are considered to be essential for viable land use and in the developing world a major pathway out of poverty Historic documentation from the period before the breed formation is scarce Thus reconstruction of the history of livestock populations depends on archaeological archeo zoological and DNA analysis of extant populations Scientific research into genetic diversity takes advantage of the rapid advances in molecular genetics Studies of mitochondrial DNA microsatellite DNA profiling and Y chromosomes have revealed details on the process of domestication on the diversity retained by breeds

and on relationships between breeds However we only see a small part of the genetic information and the advent of new technologies is most timely in order to answer many essential questions High throughput single nucleotide polymorphism genotyping is about to be available for all major farm animal species The recent development of sequencing techniques calls for new methods of data management and analysis and for new ideas for the extraction of information To make sense of this information in practical conditions integration of geo environmental and socio economic data are key elements The study and management of farm animal genomic resources FAnGR is indeed a major multidisciplinary issue The goal of the present Research Topic was to collect contributions of high scientific quality relevant to biodiversity management and applying new methods to either new genomic and bioinformatics approaches for characterization of FAnGR to the development of FAnGR conservation methods applied ex situ and in situ to socio economic aspects of FAnGR conservation to transfer of lessons between wildlife and livestock biodiversity conservation and to the contribution of FAnGR to a transition in agriculture FAnGR and agro ecology
