Unity of Science Judit Madarász,Gergely Székely,2021-05-31 This book features more than 20 papers that celebrate the work of Hajnal Andr ka and Istv n N meti It illustrates an interaction between developing and applying mathematical logic The papers offer new results as well as surveys in areas influenced by these two outstanding researchers They also provide details on the after life of some of their initiatives Computer science connects the papers in the first part of the book The second part concentrates on algebraic logic It features a range of papers that hint at the intricate many way connections between logic algebra and geometry The third part explores novel applications of logic in relativity theory philosophy of logic philosophy of physics and spacetime and methodology of science They include such exciting subjects as time travelling in emergent spacetime The short autobiographies of Hajnal Andr ka and Istv n N meti at the end of the book describe an adventurous journey from electric engineering and Maxwell s equations to a complex system of computer programs for designing Hungary s electric power system to exploring and contributing deep results to Tarskian algebraic logic as the deepest core theory of such questions then on to applications of the results in such exciting new areas as relativity theory in order to rejuvenate logic itself   **Quantized Number Theory, Fractal Strings And The Riemann Hypothesis: From Spectral Operators To Phase Transitions And Universality** Hafedh Herichi,Michel L Lapidus,2021-07-27 Studying the relationship between the geometry arithmetic and spectra of fractals has been a subject of significant interest in contemporary mathematics This book contributes to the literature on the subject in several different and new ways In particular the authors provide a rigorous and detailed study of the spectral operator a map that sends the geometry of fractal strings onto their spectrum To that effect they use and develop methods from fractal geometry functional analysis complex analysis operator theory partial differential equations analytic number theory and mathematical physics Originally M L Lapidus and M van Frankenhuijsen heuristically introduced the spectral operator in their development of the theory of fractal strings and their complex dimensions specifically in their reinterpretation of the earlier work of M L Lapidus and H Maier on inverse spectral problems for fractal strings and the Riemann hypothesis One of the main themes of the book is to provide a rigorous framework within which the corresponding question Can one hear the shape of a fractal string or equivalently Can one obtain information about the geometry of a fractal string given its spectrum can be further reformulated in terms of the invertibility or the quasi invertibility of the spectral operator The infinitesimal shift of the real line is first precisely defined as a differentiation operator on a family of suitably weighted Hilbert spaces of functions on the real line and indexed by a dimensional parameter c Then the spectral operator is defined via the functional calculus as a function of the infinitesimal shift In this manner it is viewed as a natural quantum analog of the Riemann zeta function More precisely within this framework the spectral operator is defined as the composite map of the Riemann zeta function with the infinitesimal shift viewed as an unbounded normal operator acting on the above Hilbert space It is shown that the quasi invertibility of the spectral operator is intimately connected to the existence of critical zeros of the Riemann zeta function leading to a new

spectral and operator theoretic reformulation of the Riemann hypothesis Accordingly the spectral operator is quasi invertible for all values of the dimensional parameter c in the critical interval 0 1 other than in the midfractal case when c 1 2 if and only if the Riemann hypothesis RH is true A related but seemingly quite different reformulation of RH due to the second author and referred to as an asymmetric criterion for RH is also discussed in some detail namely the spectral operator is invertible for all values of c in the left critical interval 0 1 2 if and only if RH is true These spectral reformulations of RH also led to the discovery of several mathematical phase transitions in this context for the shape of the spectrum the invertibility the boundedness or the unboundedness of the spectral operator and occurring either in the midfractal case or in the most fractal case when the underlying fractal dimension is equal to or 1 respectively In particular the midfractal dimension c 1 2 is playing the role of a critical parameter in quantum statistical physics and the theory of phase transitions and critical phenomena Furthermore the authors provide a quantum analog of Voronin s classical theorem about the universality of the Riemann zeta function Moreover they obtain and study quantized counterparts of the Dirichlet series and of the Euler product for the Riemann zeta function which are shown to converge in a suitable sense even inside the critical strip For pedagogical reasons most of the book is devoted to the study of the quantized Riemann zeta function However the results obtained in this monograph are expected to lead to a quantization of most classic arithmetic zeta functions hence further naturally quantizing various aspects of analytic number theory and arithmetic geometry The book should be accessible to experts and non experts alike including mathematics and physics graduate students and postdoctoral researchers interested in fractal geometry number theory operator theory and functional analysis differential equations complex analysis spectral theory as well as mathematical and theoretical physics Whenever necessary suitable background about the different subjects involved is provided and the new work is placed in its proper historical context Several appendices supplementing the main text are also included　　*Transactions ...* Illuminating Engineering Society,1920　　**Algebraic and Complex Geometry** Anne Frühbis-Krüger,Remke Nanne Kloosterman,Matthias Schütt,2014-10-01 Several important aspects of moduli spaces and irreducible holomorphic symplectic manifolds were highlighted at the conference Algebraic and Complex Geometry held September 2012 in Hannover Germany These two subjects of recent ongoing progress belong to the most spectacular developments in Algebraic and Complex Geometry Irreducible symplectic manifolds are of interest to algebraic and differential geometers alike behaving similar to K3 surfaces and abelian varieties in certain ways but being by far less well understood Moduli spaces on the other hand have been a rich source of open questions and discoveries for decades and still continue to be a hot topic in itself as well as with its interplay with neighbouring fields such as arithmetic geometry and string theory Beyond the above focal topics this volume reflects the broad diversity of lectures at the conference and comprises 11 papers on current research from different areas of algebraic and complex geometry sorted in alphabetic order by the first author It also includes a full list of speakers with all titles and abstracts　　**Information Retrieval Models**
