**Quantitative Reasoning in the Context of Energy and Environment** Robert Mayes, James Myers, 2015-01-19 This book provides professional development leaders and teachers with a framework for integrating authentic real world performance tasks into science technology engineering and mathematics STEM classrooms We incorporate elements of problem based learning to engage students around grand challenges in energy and environment place based learning to motivate students by relating the problem to their community and Understanding by Design to ensure that understanding key concepts in STEM is the outcome Our framework has as a basic tenet interdisciplinary STEM approaches to studying real world problems We invited professional learning communities of science and mathematics teachers to bring multiple lenses to the study of these problems including the sciences of biology chemistry earth systems and physics technology through data collection tools and computational science modeling approaches engineering design around how to collect data and mathematics through quantitative reasoning Our goal was to have teachers create opportunities for their students to engage in real world problems impacting their place problems that could be related to STEM grand challenges demonstrating the importance and utility of STEM We want to broaden the participation of students in STEM which both increases the future STEM workforce providing our next generation of scientists technologists engineers and mathematicians as well as producing a STEM literate citizenry that can make informed decisions about grand challenges that will be facing their generation While we provide a specific example of an interdisciplinary STEM module we hope to do more than provide a single fish Rather we hope to teach you how to fish so you can create modules that will excite your students

Complementarity Modeling in Energy Markets Steven A. Gabriel, Antonio J. Conejo, J. David Fuller, Benjamin F. Hobbs, Carlos Ruiz, 2012-07-20 This addition to the ISOR series introduces complementarity models in a straightforward and approachable manner and uses them to carry out an in depth analysis of energy markets including formulation issues and solution techniques In a nutshell complementarity models generalize a optimization problems via their Karush Kuhn Tucker conditions b on cooperative games in which each player may be solving a separate but related optimization problem with potentially overall system constraints e g market clearing conditions c onomic and engineering problems that aren't specifically derived from optimization problems e g spatial price equilibria d problems in which both primal and dual variables prices appear in the original formulation e g The National Energy Modeling System NEMS or its precursor PIES As such complementarity models are a very general and flexible modeling format A natural question is why concentrate on energy markets for this complementarity approach s it turns out energy or other markets that have game theoretic aspects are best

modeled by complementarity problems The reason is that the traditional perfect competition approach no longer applies due to deregulation and restructuring of these markets and thus the corresponding optimization problems may no longer hold Also in some instances it is important in the original model formulation to involve both primal variables e g production as well as dual variables e g market prices for public and private sector energy planning Traditional optimization problems can not directly handle this mixing of primal and dual variables but complementarity models can and this makes them all that more effective for decision makers
