worldwide reservoir activity Reliability Physics and Engineering J. W. McPherson, 2010-08-05 All engineers could benefit from at least one course in reliability physics and engineering It is very likely that starting with your very first engineering position you will be asked how long is your newly developed device expected to last This text was designed to help you to answer this fundamentally important question All materials and devices are expected to degrade with time so it is very natural to ask how long will the product last The evidence for material device degradation is apparently everywhere in nature A fresh coating of paint on a house will eventually crack and peel Doors in a new home can become stuck due to the shifting of the foundation The new nish on an automobile will oxidize with time The tight tolerances associated with newly meshed gears will deteriorate with time Critical parameters associated with high precision semiconductor devices threshold voltages drive currents interconnect resistances capacitor leakages etc will degrade with time In order to understand the lifetime of the material device it is important to understand the reliability physics kinetics for each of the potential failure mechanisms and then be able to develop the required reliability engineering methods that can be used to prevent or at least minimize the occurrence of device failure
