Algorithm Concept for Crash Detection in Passenger Cars André Leschke, 2020-03-18 State of the art airbag algorithms make a decision to fire restraint systems in a crash by evaluating the deceleration of the entire vehicle during the single events of the accident In order to meet the ever increasing requirements of consumer test organizations and global legislators a detailed knowledge of the nature and direction of the crash would be of great benefit The algorithms used in current vehicles can only do this to a limited extent Andr Leschke presents a completely different algorithm concept to solve these problems In addition to vehicle deceleration the chronological sequence of an accident and the associated local and temporal destruction of the vehicle are possible indicators for an accident s severity About the Author Dr Andr Leschke has earned his doctoral degree from Tor Vergata University of Rome Italy Currently he is working as head of a team of vehicle safety developers in the German automotive industry

Advanced Microsystems for Automotive Applications 2009 Gereon Meyer, Jürgen Valldorf, Wolfgang Gessner, 2009-04-15 The current economic crisis is cutting the automotive sector to the quick Public authorities worldwide are now faced with requests for providing loans and accepting guarantees and even for putting large automotive companies under state control Assessing the

long term benefits of such help and weighing the needs of different sectors against each other poses a major challenge for the national policies. Given the upcoming change of customer preferences and state regulations towards safety, sustainability and comfort of a car, the automotive industry is particularly called to prove its ability to make necessary innovations available in order to accelerate its pace to come out of the crisis. Consequently, the Green Car is assuming a prominent role in the current debate. Various power train concepts are currently under discussion for the Green Car, including extremely optimised internal combustion engines, hybrid drives and battery electric traction. Electrical cars are the most appealing option because they are free of local emissions and provide the opportunity to use primary energy from sources other than crude oil for transport. Well-to-wheel analysis shows that their greenhouse gas emissions can be rated negligibly small if electricity from renewable sources like wind and solar is used.

Vehicle Crash Mechanics Matthew Huang, 2002-06-19. Governed by strict regulations and the intricate balance of complex interactions among variables, the application of mechanics to vehicle crashworthiness is not a simple task. It demands a solid understanding of the fundamentals, careful analysis and practical knowledge of the tools and techniques of that analysis. Vehicle Crash Mechanics SAE International's Dictionary of Vehicle Accident Reconstruction and Automotive Safety R. Matthew Brach, PhD, PE, 2023-10-23. This invaluable dictionary springs from the foundation laid by the glossary in Vehicle Accident Analysis and Reconstruction Methods Third Edition, created by the disbanded SAE Accident Investigation and Reconstruction Practices Committee. AIRP Building on this content, this book encompasses a wide array of terms derived from both accident reconstruction and automotive safety. While biomechanics contributes numerous terms related to automotive safety concerning occupants, accident reconstruction primarily caters to vehicular elements. Unlike typical glossaries, this compendium doesn't just define; it references the sources related to the concept. Diving into SAE standards, recommended practices and other renowned texts, this dictionary paints a complete picture. Even as the automotive landscape evolves, this work stands as an extensive reference for students and professionals alike.
