with in a piecemeal manner within different contexts The interpretation of the concept is also subtly different in each case This book will draw these diverse threads together and present entropy as one of the crucial physical concepts It will cover a range of different applications of entropy from the classical theory of thermodynamics the statistical approach entropy in quantum theory information theory and finally its manifestation in black hole physics Each will be presented in a manner suitable for undergraduates and interested laypersons with no previous knowledge The book will take an overview of these areas and see to what extent the concept of entropy is being treated in the same way in each and how it differs Key Features Provides an accessible introduction to the exciting topic of entropy setting out its manifestations in classical thermodynamics statistical mechanics and information theory Covers applications in black holes quantum theory and Big Bang cosmology

An Introductory Philosophy of Medicine James A. Marcum, 2008-05-07 In this book the author explores the shifting philosophical boundaries of modern medical knowledge and practice occasioned by the crisis of quality of care especially in terms of the various humanistic adjustments to the biomedical model To that end he examines the metaphysical epistemological and ethical boundaries of these medical models He begins with their metaphysics analyzing the metaphysical positions and presuppositions and ontological commitments upon which medical knowledge and practice is founded Next he considers the epistemological issues that face these medical models particularly those driven by methodological procedures undertaken by epistemic agents to constitute medical knowledge and practice Finally he examines the axiological boundaries and the ethical implications of each model especially in terms of the physician patient relationship In a concluding Epilogue he discusses how the philosophical analysis of the humanization of modern medicine helps to address the crisis of care as well as the question of What is medicine The book s unique features include a comprehensive coverage of the various topics in the philosophy of medicine that have emerged over the past several decades and a philosophical context for embedding bioethical discussions The book s target audiences include both undergraduate and graduate students as well as healthcare professionals and professional philosophers This book is the 99th issue of the Series Philosophy and Medicine and it can be considered a crown of thirty years of intensive and dynamic discussion in the field We are completely convinced that after its publication it can be finally said that undoubtedly the philosophy of medicine exists as a special field of inquiry

Neuromimetic Semantics Harry Howard,2010-08-10 This book attempts to marry truth conditional semantics with cognitive linguistics in the church of computational neuroscience To this end it examines the truth conditional meanings of coordinators quantifiers and collective predicates as neurophysiological phenomena that are amenable to a neurocomputational analysis Drawing inspiration from work on visual processing and especially the simple complex cell distinction in early vision V1 we claim that a similar two layer architecture is sufficient to learn the truth conditional meanings of the logical coordinators and logical quantifiers As a prerequisite much discussion is given over to what a neurologically plausible representation of the meanings of these items would look like We eventually settle on a representation in terms of correlation so that for instance the semantic input to the universal operators e g and all is represented as maximally correlated while the semantic input to the universal negative operators e g nor no is represented as maximally anticorrelated On the basis this representation the hypothesis can be offered that the function of the logical operators is to extract an invariant feature from natural situations that of degree of correlation between parts of the situation This result sets up an elegant formal analogy to recent models of visual processing which argue that the function of early vision is to reduce the redundancy inherent in natural images Computational simulations are designed in which the logical operators are learned by associating their phonological form with some degree of correlation in the inputs so that the overall function of the system is as a simple kind of pattern recognition Several learning rules are assayed especially those of the

Hebbian sort which are the ones with the most neurological support Learning vector quantization LVQ is shown to be a perspicuous and efficient means of learning the patterns that are of interest We draw a formal parallelism between the initial competitive layer of LVQ and the simple cell layer in V1 and between the final linear layer of LVQ and the complex cell layer in V1 in that the initial layers are both selective while the final layers both generalize It is also shown how the representations argued for can be used to draw the traditionally recognized inferences arising from coordination and quantification and why the inference of subalternacy breaks down for collective predicates Finally the analogies between early vision and the logical operators allow us to advance the claim of cognitive linguistics that language is not processed by proprietary algorithms but rather by algorithms that are general to the entire brain Thus in the debate between objectivist and experiential metaphysics this book falls squarely into the camp of the latter Yet it does so by means of a rigorous formal mathematical and neurological exposition in contradiction of the experiential claim that formal analysis has no place in the understanding of cognition To make our own counter claim as explicit as possible we present a sketch of the LVQ structure in terms of mereotopology in which the initial layer of the network performs topological operations while the final layer performs mereological operations The book is meant to be self contained in the sense that it does not assume any prior knowledge of any of the many areas that are touched upon It therefore contains mini summaries of biological visual processing especially the retinocortical and ventral what parvocellular pathways computational models of neural signaling and in particular the reduction of the Hodgkin Huxley equations to the connectionist and integrate and fire neurons Hebbian learning rules and the elaboration of learning vector quantization the linguistic pathway in the left hemisphere memory and the hippocampus truth conditional vs image schematic semantics objectivist vs
