**Pollinators in the Anthropocene: How Multiple Environmental Stressors Are Shaping Pollinator Health** Lars Straub, Fabio Sgolastra, Pierre Lau, Geoffrey Williams, 2023-10-03 There is consensus that loss of biodiversity is a defining feature of the Anthropocene with potentially severe consequences for human food security and well being Of particular concern are global declines in insect pollinators such as bees flies beetles and butterflies as their roles in sustaining ecosystem functions and ensuring food production are indispensable A wide array of abiotic and biotic stressors likely govern the observed insect declines and losses of wild and managed insect pollinators respectively For instance habitat destruction and fragmentation can not only lead to smaller and isolated populations that are vulnerable to environmental stochasticity or inbreeding depression but also lead to poor nutrition as floral abundance and diversity are reduced Further key stressors are pests and pathogens climate change intensified agriculture and environmental pollution e g pesticides These environmental stressors may interact with one another and generate complex effects that amplify the direct consequences of a single given stressor Unfortunately there is a lack of knowledge concerning how even the most important environmental stressors may

interact to affect insect pollinators The goal of this effort is to develop a platform that brings together the latest information on how abiotic and biotic stressors interact to impact insect pollinator health Only by bringing together different lines of evidence will we be able to better predict how these environmental stressors will affect insect pollinators An improved understanding will also facilitate the development of more effective and sustainable management strategies that will enable stakeholders to implement adequate and sustainable measures to safeguard insect pollinators This Research Topic welcomes both Original Research and Reviews as well as Commentary or Opinion articles that address the topic of environmental stressor interactions and their impact on insect pollinator health Submissions should be based on but not limited to How combined environmental stressors affect insect pollinators using molecular physiological behavioral ecological or evolutionary approaches Experimental or survey work conducted under laboratory semi field or field conditions Unravelling the mechanisms underlying combined stressor interactions What can be done to limit the impact of combined environmental exposure in the field

*The Far Right and the Environment* Bernhard Forchtner,2019-09-10 At the beginning of the twenty first century both the crisis of liberal democracy as visible in for example the rise of far right actors in Europe and the United States and environmental crises from declining biodiversity to climate change are increasingly in the public spotlight Whilst both areas have been analysed extensively on their own *The Far Right and the Environment* Politics Discourse and Communication provides much needed insights into their intersection by illuminating the environmental communication of far right party and non party actors in Europe and the United States Although commonly perceived as a left wing issue today concerns over the natural environment by the far right have a long ideology driven history Thus it is not surprising that some members of the far right offer distinctive ecological visions of communal life though for example climate change scepticism is voiced too Investigating this range of stances within their discourse about the natural environment provides a window into the wider politics of the far right and points to a close connection between the politics of identity and the imagination of nature Connecting the fields of environmental communication and study of the far right contributions to this edited volume therefore offer timely assessments of this often overlooked dimension of far right politics Treatise on Marine Ecology and Paleoecology National Research Council (U.S.).
