

NATURE AND CHARACTERISTICS OF RIVER TERRACES

River terraces are among the most important characteristics of the shape of many valleys in the Himalayas. Individual spreads of terrace surfaces are small—forming horizontal or gently-inclined breaks in the valley-side slopes. Sometimes they are no more than a ledge recognizable only to the practised eye. In other cases, they are of considerable breadth, apparent at the first sight, and form a prominent feature of the physiognomy of the river valley.

Types of River Terraces

River terraces, in varying degrees of preservation extend along the sides of valleys and determine their cross-profile. They can be distinguished from the stepped longitudinal profile of mountainous valleys (especially those in the Himalayas and the Alps). A two-fold characteristic can be observed among the terraces. The first involves their composition. Many are formed in the bedrock of the valley side and carry little or no gravel upon them; these are 'rock' or 'strath' terraces. Others, in contrast, are built of gravel, of heavy thickness, descending to the valley floor or at least resting on bedrock only at some considerable depth. These are 'alluvial' or 'gravel' terraces. Since the second characteristic depends upon the size of sediment, it is more difficult to interpret, but genetically still more significant, and this is of first importance in distinguishing rock terraces from gravel terraces. Some rock-terraces, often covered by a thin veneer of gravels, run roughly parallel with the valley floor, rather like the surface of gravel terraces. But unlike gravel terraces, they truncate the strata, unless by chance the strata have the same low inclination as the valley floor, and show no relation. In this case, the base of many of the terraces is determined for a short distance by a rock ledge. The terraces of Alpine valleys as showed by Rutimeyer in 1869, and the terraces of the Rhine valley in the Rhine Massif, are of this type. The other kind has nothing to do with the valley floor, but is more or less markedly inclined in the opposite direction and generally coincides with particular beds or other structural surfaces. They are extra-ordinarily common on a small scale, less frequent on a larger one, as they can occur on a large scale only on more moderately inclined strata beds. The first kind are old valley floors, corresponding to a halt in erosion and the formation of a wide valley floor. They are termed terraces of erosional stillstand or simply erosion terraces. The other type have nothing to do with erosion, but are developed by weathering and denudation. They are called

Geocology of Landscape Dynamics Seema Sahdev,R. B. Singh,Manish Kumar,2020-03-03 This book provides an overview of the ecological indicators of landscape dynamics in the context of geographical landscape integration Landscape dynamics depicts every change that occurs in the physical biological and cognitive assets of a landscape To understand and interpret the complex physical biological and cognitive phenomena of landscapes it is necessary to operate conceptually and practically on a broad range of spatial and temporal scales Rapid land use changes have become a concern to environmentalists and planners because of their impacts on the natural ecosystem which further determines socioeconomic dynamics In this regard the book discusses case studies that share new insights into how landscape patterns and processes impact small creatures and how small creatures in turn influence landscape structure and composition In turn the relevant aspects of land use and land cover dynamics are covered and the multi faceted relationship between the substrata and ecological community is highlighted The book is unique in its focus on the application of spatial informatics such as automatic building extraction from high resolution imagery a soil resource inventory for meeting the challenges of land degradation hydrological modeling the temporal variation analysis of glacier area and the identification and mapping of glacial lakes morphometric analysis of river basins and the monitoring and modeling of urban sprawl among other features

ATLAS OF STRUCTURAL GEOLOGICAL AND GEOMORPHOLOGICAL INTERPRETATION OF REMOTE SENSING IMAGES

An extensive compilation of case studies in structural geology and geomorphology for interpreting remotely sensed images In the Atlas of Structural Geological and Geomorphological Interpretation of Remote Sensing Images a team of experts delivers an extensive collection of over 20 different examples of structural geological and geomorphological studies by remote sensing The book demonstrates how to properly interpret geological features and gather robust and reliable information from remote sensing images This atlas contains high quality colour images that depict a diversity of structures and geomorphic features from different tectonic regimes and geographic localities in the Americas Europe and Australasia While its primary emphasis is on structural geology geomorphology is considered in some depth as well The examples also cover geological hazards including volcanic eruptions and earthquakes Readers will also find A thorough introduction to the background of

remote sensing including foundational concepts and the classification of remote sensing based on data type source platform and imaging media Comprehensive discussions of geomorphology including explorations of lava fissures badlands and beaches In depth explorations of structural geology including discussions of deformation bands fault lines and earthquake effects Several examples of how to trace hydrological processes such as glacier retreat changes in drainage patterns and bar formation Perfect for advanced students and researchers in the geoscience community Atlas of Structural Geological and Geomorphological Interpretation of Remote Sensing Images will also earn a place in the libraries of practicing professionals with an interest in the interpretation of remote sensing images
